# Anybus<sup>®</sup> CompactCom 30 EtherNet/IP

Doc.Id. HMSI-168-80 Rev. 3.11

HALMSTAD · CHICAGO · KARLSRUHE · TOKYO · BEIJING · MILANO · MULHOUSE · COVENTRY · PUNE · COPENHAGEN

# **Important User Information**

This document is intended to provide a good understanding of the functionality offered by EtherNet/IP. The document only describes the features that are specific to the Anybus CompactCom 30 EtherNet/IP w. IT Functionality. For general information regarding the Anybus CompactCom 30, consult the Anybus CompactCom 30 design guides.

The reader of this document is expected to be familiar with high level software design, and communication systems in general. The use of advanced EtherNet/IP-specific functionality may require in-depth knowledge in Ether-Net/IP networking internal and/or information from the official EtherNet/IP specifications. In such cases, the people responsible for the implementation of this product should either obtain the EtherNet/IP specification to gain sufficient knowledge or limit their implementation in such a way that this is not necessary.

### Liability

Every care has been taken in the preparation of this manual. Please inform HMS Industrial Networks AB of any inaccuracies or omissions. The data and illustrations found in this document are not binding. We, HMS Industrial Networks AB, reserve the right to modify our products in line with our policy of continuous product development. The information in this document is subject to change without notice and should not be considered as a commitment by HMS Industrial Networks AB. HMS Industrial Networks AB assumes no responsibility for any errors that may appear in this document.

There are many applications of this product. Those responsible for the use of this device must ensure that all the necessary steps have been taken to verify that the applications meet all performance and safety requirements including any applicable laws, regulations, codes, and standards.

HMS Industrial Networks AB will under no circumstances assume liability or responsibility for any problems that may arise as a result from the use of undocumented features, timing, or functional side effects found outside the documented scope of this product. The effects caused by any direct or indirect use of such aspects of the product are undefined, and may include e.g. compatibility issues and stability issues.

The examples and illustrations in this document are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular implementation, HMS Industrial Networks AB cannot assume responsibility for actual use based on these examples and illustrations.

### Intellectual Property Rights

HMS Industrial Networks AB has intellectual property rights relating to technology embodied in the product described in this document. These intellectual property rights may include patents and pending patent applications in the US and other countries.

### **Trademark Acknowledgements**

Anybus ® is a registered trademark of HMS Industrial Networks AB. All other trademarks are the property of their respective holders.

Warning:	This is a class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.
ESD Note:	This product contains ESD (Electrostatic Discharge) sensitive parts that may be damaged if ESD control procedures are not followed. Static control precautions are required when handling the product. Failure to observe this may cause damage to the product.

# P.3 Conventions & Terminology

The following conventions are used throughout this manual:

- Numbered lists provide sequential steps
- Bulleted lists provide information, not procedural steps
- The terms 'Anybus' or 'module' refers to the Anybus CompactCom module.
- The terms 'host' or 'host application' refers to the device that hosts the Anybus module.
- Hexadecimal values are written in the format NNNNh or 0xNNNN, where NNNN is the hexadecimal value.
- A byte always consists of 8 bits.

# P.4 Support

For general contact information and where to find support, please refer to the contact and support pages at www.anybus.com.

# 1. About the Anybus CompactCom 30 EtherNet/IP

# 1.1 General

The Anybus CompactCom 30 EtherNet/IP communication module provides instant Ethernet and EtherNet/IP connectivity via the patented Anybus CompactCom host interface. Any device that supports this standard can take advantage of the features offered by the module, allowing seamless network integration regardless of network type.

The modular approach of the Anybus CompactCom platform allows the CIP-object implementation to be extended to fit specific application requirements. Furthermore, the Identity Object can be customized, allowing the end product to appear as a vendor-specific implementation rather than a generic Anybus module.

This product conforms to all aspects of the host interface for Active modules defined in the Anybus CompactCom 30 Hardware- and Software Design Guides, making it fully interchangeable with any other device following that specification. Generally, no additional network related software support is needed, however in order to be able to take full advantage of advanced network specific functionality, a certain degree of dedicated software support may be necessary.

# 1.2 Features

- Galvanically isolated bus electronics
- 10/100 Mbit, full/half duplex operation
- Web server w. customizable content
- FTP server
- E-mail client
- Server Side Include (SSI) functionality
- Customizable Identity Information
- Up to 65535 ADIs
- CIP Parameter Object support
- Expandable CIP-object implementation
- Supports unconnected CIP routing
- Transparent Socket Interface

# 2. Tutorial

# 2.1 Introduction

This chapter is a complement to the Anybus CompactCom Implementation Tutorial. The ABCC tutorial describes and explains a simple example of an implementation with Anybus CompactCom 30. This chapter includes network specific settings that are needed for a host application to be up and running and possible to certify for use on EtherNet/IP networks.

# 2.2 Fieldbus Conformance Notes

- The Anybus CompactCom 30 EtherNet/IP has been pre-compliance tested by ODVA's authorized Independent Test Lab and found to comply with the ODVA Conformance Test Software. However, in accordance with ODVA's conformance test policy, the final product must still be compliance tested to ensure fieldbus conformance. In order to be able to do this, the vendor information in the EtherNet/IP Host Object must be customized.
- It is strongly recommended to customize the information in the Identity Object (CIP), to enable the product to appear as a vendor specific implementation rather than a generic Anybus module. ODVA requires that all manufacturers use their own Vendor ID. A Vendor ID can be applied for from ODVA.

For further information, please contact HMS or ODVA.

# 2.3 Conformance Test Guide

When using the default settings of all parameters, the Anybus CompactCom 30 EtherNet/IP module is precertified for network compliance. This precertification is done to ensure that your product *can* be certified, but it does not mean that your product will not require certification.

Any change in the parameters in the EDS file, supplied by HMS, will require a certification. A Vendor ID can be obtained from ODVA and is compulsory for certification. This section provides a guide for successful conformance testing your product, containing the Anybus CompactCom 30 EtherNet/IP module, to comply with the demands for network certification set by the ODVA.

Independent of selected operation mode, the actions described in this section have to be accounted for in the certification process. The identity of the product needs to be changed to match your company and device.

**IMPORTANT:** This section provides guidelines and examples of what is needed for certification. Depending on the functionality of your application, there may be additional steps to take. Please contact HMS Industrial Networks at www.anybus.com for more information.

## 2.3.1 Reidentifying Your Product

After successful setting of the "Setup Complete" attribute in the Anybus Object (01h), the Anybus module asks for identification data from the EtherNet/IP Host Object (F8h) and the Ethernet Host Object (F9h). Therefore, the attributes listed below shall be implemented and proper values returned.

Object/Instance	Attribute	Explanation	Default	Customer sample	Comment
EtherNet/IP Host Object (F8h), Instance 1	#1, Vendor ID	With this attribute you set the Vendor ID of the device.	Vendor ID: 005Ah (HMS)	Vendor ID:1111h	This information must match the keyword values of the "Device" section in the EDS file.
EtherNet/IP Host Object (F8h), Instance 1	#2, Device Type <sup>a</sup>	With this attribute you set the Device Type of the device.	Device Type: 0000h	Device Type: 002Bh <sup>a</sup> (Generic Device (key- able))	
EtherNet/IP Host Object (F8h), Instance 1	#3, Product Code	With this attribute you set the Product Code of the device	0063h	2222h	
EtherNet/IP Host Object (F8h), Instance 1	#4, Revision	With this attribute you set the Revision of the device.		1.1	
EtherNet/IP Host Object (F8h), Instance 1	#5, Serial Number	With this attribute you set the Serial Number of the device.		12345678h	Unique number for all CIP devices produced with the same 'Vendor ID.
EtherNet/IP Host Object (F8h), Instance 1	#6, Product Name	With this attribute you set the Product Name of the device.	Anybus-CC Ether- Net/IP	"Widget"	This information must match the keyword values of the "Device" section in the EDS file.
Ethernet Host Object (F9h), Instance 1	#1, MAC address	With this attribute you set theMAC address of the device.		00-11-22-33-44-55	6 byte physical address value from range obtained from IEEE

a. The Device Type default value 0000h must be changed for the module to pass a conformance test. If no other specific profile is implemented, use the value 002Bh (Generic Device (keyable)).

### 2.3.2 Factory Default Reset

#### Reset command to Application Object (FFh) must be supported

When Anybus modules are delivered, they are required to be in their "Factory Default" state. For Anybus CompactCom 30 EtherNet/IP devices this means that the IP suite is not assigned (IP 0.0.0.0). When a Factory Default Reset command is received from the network, the Anybus module will erase all IP information and inform the host application that a reset of the Anybus module is required. This is done by sending a Reset command to the Application Object (FFh) of the host (Power-on + Factory Default). For more details, please consult the Anybus CompactCom 30 Software Design Guide.

### 2.3.3 IP address

Normally the IP numbers of the devices are assigned via a DHCP servier. HMS recommends not using the Network Configuration Object (04h, instances #3 - #11) during the initialization phase for Ether-Net/IP modules, unless the end user has requested the IP address to be set to a specific value (by for example using a keypad). The reason is that when a factory default reset command is received from the EtherNet/IP network (via DHCP) the node must be available after reset with the DHCP enabled.

# 3. Basic Operation

# 3.1 General Information

## 3.1.1 Software Requirements

Generally, no additional network support code needs to be written in order to support the Anybus CompactCom 30 EtherNet/IP. However, due to the nature of the EtherNet/IP networking system, certain restrictions must be taken into account:

- Certain functionality in the module requires that the command 'Get\_Instance\_Number\_By\_Order' (Application Data Object, FEh) is implemented in the host application.
- Up to 5 diagnostic instances (See 9-70 "Diagnostic Object (02h)") can be created by the host application during normal conditions. An additional 6th instance may be created in event of a major fault.
- EtherNet/IP in itself does not impose any specific timing demands when it comes to acyclic requests (i.e. requests towards instances in the Application Data Object), however it is generally recommended to process and respond to such requests within a reasonable time period (exactly what this means in practice depends on the implementation and the actual installation).
- The use of advanced CIP-specific functionality may require in-depth knowledge in CIP networking internals and/or information from the official CIP and EtherNet/IP specifications. In such cases, the people responsible for the implementation of this product is expected either to obtain these specifications to gain sufficient knowledge or limit their implementation is such a way that this is not necessary.

For in-depth information regarding the Anybus CompactCom software interface, consult the general Anybus CompactCom 30 Software Design Guide.

See also ....

- "Diagnostic Object (02h)" on page 70 (Anybus Module Object)
- Anybus CompactCom 30 Software Design Guide, 'Application Data Object (FEh)'

# 3.2 Device Customization

### 3.2.1 Network Identity

By default, the module uses the following identity settings:

- Vendor ID: 005Ah (HMS Industrial Networks)
- Device Type: 0000h (Generic Device)
- Product Code: 0063h (Anybus CompactCom 30 EtherNet/IP)
- Product Name: 'Anybus-CC EtherNet/IP'

Optionally, it is possible to customize the identity of the module by implementing the corresponding instance attributes in the EtherNet/IP Host Object.

See also ....

- "Identity Object (01h)" on page 46 (CIP-object)
- "EtherNet/IP Host Object (F8h)" on page 118 (Host Application Object)

**IMPORTANT:** According to the CIP specification, the combination of Vendor ID and serial number <u>must</u> be unique. It is <u>not</u> permitted to use a custom serial number in combination with the HMS Vendor ID (005Ah), nor is it permitted to choose Vendor ID arbitrarily. Failure to comply to this requirement will induce interoperability problems and/or other unwanted side effects. HMS approves use of the HMS Vendor ID (005Ah), in combination with the default serial number, under the condition that the implementation requires no deviations from the standard EDS-file.

To obtain a Vendor ID, contact the ODVA.

### 3.2.2 Electronic Data Sheet (EDS)

On EtherNet/IP, the characteristics of a device is stored in an ASCII data file with the suffix EDS. This file is used by configuration tools etc. when setting up the network configuration. HMS supplies a standard (generic) EDS-file, which corresponds to the default settings in the module. However, due to the flexible nature of the Anybus CompactCom concept, it is possible to alter the behaviour of the product in ways which invalidates the generic EDS-file. In such case, a custom EDS-file needs to be created, which in turn invalidates the default identity information and require re-certification of the product.

**Note:** Since the module implements the Parameter Object, it is possible for configuration tools such as RSNetWorx to automatically generate a suitable EDS-file. Note that this functionality requires that the command 'Get\_Instance\_Number\_By\_Order' (Application Data Object, FEh) has been implemented in the host application.

See also ....

- "Parameter Object (0Fh)" on page 56 (CIP-object)
- Anybus CompactCom 30 Software Design Guide, 'Application Data Object (FEh)

**IMPORTANT:** HMS approves use of the standard EDS-file only under the condition that it matches the actual implementation and that the identity information remains unchanged.

### 3.2.3 EtherNet/IP & CIP Implementation

By default, the module supports the generic CIP-profile. Optionally, it is possible to re-route requests to unimplemented CIP-objects to the host application, thus enabling support for other profiles etc.

To support a specific profile, perform the following steps:

- Set up the identity settings in the EtherNet/IP Host Object according to profile requirements.
- Set up the Assembly Instance Numbers according to profile requirements.
- Enable routing of CIP-messages to the host application in the EtherNet/IP Host Object.
- Implement the required CIP-objects in the host application.

Unconnected CIP routing is supported, which means that a message can be sent to a device without first setting up a connection.

See also ....

- "EtherNet/IP Host Object (F8h)" on page 118 (Host Application Object)
- "Command Details: Process\_CIP\_Object\_Request" on page 121

### 3.2.4 Web Interface

The web interface can be fully customized to suit a particular application. Data and web pages are stored in a FLASH-based file system, which can be accessed using any standard FTP-client.

See also ....

- "File System" on page 17
- "FTP Server" on page 18
- "Web Server" on page 20

### 3.2.5 Socket Interface (Advanced Users Only)

The built in socket interface allows additional protocols to be implemented on top of TCP/IP.

See also ....

- "Socket Interface Object (07h)" on page 79 (Anybus Module Object)
- "Message Segmentation" on page 130

# 3.3 Communication Settings

As with other Anybus CompactCom 30 products, network related communication settings are grouped in the Network Configuration Object (04h).

In this case, this includes...

• TCP/IP settings

These settings must be set properly in order for the module to be able to participate on the network.

The module supports DHCP, which may be used to retrieve the TCP/IP settings from a DHCP-server automatically. DHCP is enabled by default, but can be disabled if necessary.

#### Physical Link Settings

By default, the module uses auto negotiation to establish the physical link settings, however it is possible to force a specific setting if necessary.

The parameters in the Network Configuration Object (04h) are available from the network through the built in web server, and through the TCP/IP Interface Object (CIP).

See also ....

- "Web Server" on page 20
- "TCP/IP Interface Object (F5h)" on page 62 (CIP)
- "Ethernet Link Object (F6h)" on page 65 (CIP)
- "Network Configuration Object (04h)" on page 72 (Anybus Module Object)
- "HICP (Host IP Configuration Protocol)" on page 132

# 3.4 Diagnostics

The severity value of all pending events are combined (using logical OR) and copied to the corresponding bits in the 'Status'-attribute of the Identity Object (CIP).

See also ...

- "Identity Object (01h)" on page 46 (CIP)
- "Diagnostic Object (02h)" on page 70 (Anybus Module Object)

# 3.5 Network Data Exchange

### 3.5.1 Application Data (ADIs)

ADIs are represented through the ADI Object (CIP). Each instance within this objects corresponds directly to an instance in the Application Data Object on the host application side.

Accessible range of ADIs is 1 to 65535.

See also ....

- "Parameter Object (0Fh)" on page 56 (CIP)
- "ADI Object (A2h)" on page 58 (CIP)

## 3.5.2 Process Data

Process Data is represented as dedicated instances in the Assembly Object (CIP). Note that each ADI element is mapped on a byte-boundary, i.e. each BOOL occupies one byte.

See also ....

- "Assembly Object (04h)" on page 50 (CIP)
- "Connection Manager (06h)" on page 53 (CIP)

### 3.5.3 Translation of Data Types

The Anybus data types are translated to CIP-standard and vice versa as follows:

Anybus Data Type	CIP Data Type	Comments	
BOOL	BOOL	Each ADI element of this type occupies one byte.	
ENUM	USINT		
SINT8	SINT	-	
UINT8	USINT		
SINT16	INT	Each ADI element of this type occupies two bytes.	
UINT16	UINT		
SINT32	DINT	Each ADI element of this type occupies four bytes.	
UINT32	UDINT		
FLOAT	REAL		
CHAR	SHORT_STRING	SHORT_STRING consists of a single-byte length field (which in this case represents the number of ADI elements) followed by the actual character data (in this case the actual ADI elements). This means that a 10-character string occupies 11 bytes.	
SINT64	LINT	Each ADI element of this type occupies eight bytes.	
UINT64	ULINT		

# 3.6 File System

### 3.6.1 General Information

#### Category: Extended

The built-in file system hosts 1.43MByte of non-volatile storage, which can be accessed by the HTTP and FTP servers, the email client, and the host application.

The file system uses the following conventions:

- '\' (backslash) is used as a path separator
- A 'path' originates from the system root and as such must begin with a '\'
- A 'path' must not end with a '\'
- Names may contain spaces (' ') but must not begin or end with one.
- Names must not contain one of the following characters:  $\langle \rangle / : * ? " <> |'$
- Names cannot be longer than 48 characters
- A path cannot be longer than 255 characters (filename included)

See also ...

- "FTP Server" on page 18
- "Web Server" on page 20
- "E-mail Client" on page 26
- "Server Side Include (SSI)" on page 27
- "File System Interface Object (0Ah)" on page 101

**IMPORTANT:** The file system is located in flash memory. Due to technical reasons, each flash segment can erased approximately 100000 times before failure, making it unsuitable for random access storage.

The following operations will erase one or more flash segments:

- Deleting, moving or renaming a file or directory
- Writing or appending data to an existing file
- Formatting the file system

#### 3.6.2 System Files

The file system contains a set of files used for system configuration. These files, known as "system files", are regular ASCII files which can be altered using a standard text editor (such as the Notepad in Microsoft Windows<sup>TM</sup>). The format of these files are, with a few exceptions, based on the concept of 'keys', where each 'key' can be assigned a value, see below.

Example:

```
[Key1]
value of Key1
[Key2]
value of Key2
```

# 4. FTP Server

# 4.1 General Information

#### Category: extended

The built-in FTP-server makes it easy to manage the file system using a standard FTP client.

By default, the following port numbers are used for FTP communication:

- TCP, port 20 (FTP data port)
- TCP, port 21 (FTP command port)

The FTP server supports up to 8 concurrent connections.

# 4.2 User Accounts

User accounts are stored in the configuration file '\ftp.cfg'. This file holds the usernames, passwords, and home directory for all users. Users are not able to access files outside of their home directory.

#### File Format:

```
User1:Password1:Homedir1
User2:Password2:Homedir2
User3:Password3:Homedir3
```

Optionally, the UserN:PasswordN-section can be replaced by a path to a file containing a list of users as follows:

```
File Format ('\ftp.cfg'):
```

```
User1:Password1:Homedir1
User2:Password2:Homedir2
\path\user1istA:HomedirA
\path\user1istB:HomedirB
```

The files containing the user lists shall have the following format:

File Format:

```
User1:Password1
User2:Password2
User3:Password3
```

#### Notes:

- usernames must not exceed 15 characters in length.
- Passwords must not exceed 15 characters in length.
- usernames and passwords must only contain alphabetic characters and/or numbers.
- If '\ftp.cfg' is missing or cannot be interpreted, all username/password combinations will be accepted and the home directory will be the FTP root (i.e. '\ftp\').
- The home directory for a user must also exist in the file system if they should be able to log in, just adding the user information to the 'ftp.cfg' file it is not enough.

- If 'Admin Mode' has been enabled in the Ethernet Object, all username/password combinations will be accepted and the user will have unrestricted access to the file system (i.e. the home directory will be the system root).
- It is strongly recommended to have at least one user with root access ('\') permission. If not, 'Admin Mode' must be enabled each time a system file needs to be altered (including '\ftp.cfg').

# 4.3 Session Example

The Windows Explorer features a built-in FTP client which can easily be used to access the file system as follows:

- 1. Open the Windows Explorer by right-clicking on the 'Start'-button and selecting 'Explorer'
- 2. In the address field, type FTP://<user>:<password>@<address>
  - Substitute <address> with the IP address of the Anybus module
  - Substitute <user> with the username
  - Substitute <password> with the password

**3.** Press enter. The Explorer will now attempt to connect to the Anybus module using the specified settings. If successful, the file system will be displayed in the Explorer window.

# 5. Web Server

# **5.1 General Information**

#### Category: extended

The built-in web server provides a flexible environment for end-user interaction and configuration purposes. The powerful combination of SSI and client-side scripting allows access to objects and file system data, enabling the creation of advanced graphical user interfaces.

The web interfaces is stored in the file system, which can be accessed through the FTP server. If necessary, the web server can be completely disabled in the Ethernet Host Object.

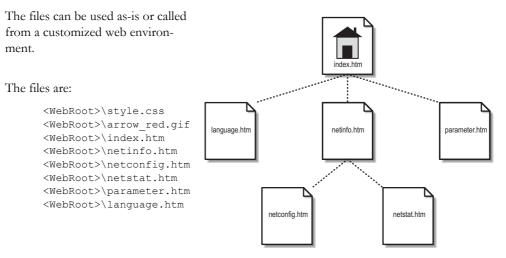

The web server supports up to 20 concurrent connections and communicates through port 80.

See also ....

- "FTP Server" on page 18
- "Server Side Include (SSI)" on page 27
- "Ethernet Host Object (F9h)" on page 141

# 5.2 Default Web Pages

The default web interface consists of a set of virtual files; these virtual files may be replaced, but not permanently erased, by placing files with the same name in the same location (i.e. the web root).

**Note:** If none of these files are used, it is recommended to completely disable the virtual file system altogether in the File System Interface Object.

See also ...

- "File System" on page 17
- "File System Interface Object (0Ah)" on page 101

# 5.2.1 Network Configuration

The network configuration page provides an interface for changing TCP/IP and SMTP settings in the Network Configuration Object.

### Anybus-CC EtherNet/IP Network configuration

IP Configuration	
IP address:	10.11.20.152
Subnet mask:	255.255.0.0
Gateway:	10.11.0.1
Host name:	
Domain name:	hms.se
DNS1:	10.10.20.6
DNS2:	10.10.12.12
DHCP:	
	Store settings

SMTP Settings	
SMTP Server:	
SMTP User:	
SMTP Pswd:	
	Store settings

Ethernet Configuration	
Comm Settings:	Auto 👻
	Store settings

Main Network interface

The module needs to be reset for the TCP/IP and SMTP settings to take effect. The Ethernet Configuration settings will take effect immediately.

Available editable settings will be explained on the next page.

#### **IP** Configuration

The module needs a reset for any changes to take effect.

Name	Description
IP address	The TCP/IP settings of the module
Subnet mask	Default values: 0.0.0.0
Gateway	Value ranges: 0.0.0.0 - 255.255.255.255
Host name	IP address or name Max 64 characters
Domain name	IP address or name Max 48 characters
DNS 1	Primary and secondary DNS server, used to resolve host name
DNS 2	Default values: 0.0.0.0 Value ranges: 0.0.0.0 - 255.255.255.255
DHCP	Checkbox for enabling or disabling DHCP Default value: enabled

#### **SMTP Settings**

The module needs a reset for the changes to take effect.

Name	Description
SMTP Server	IP address
	Max 64 characters
SMTP User	Max 64 characters
SMTP Pswd	Max 64 characters

## **Ethernet Configuration**

Changes will take effect immediately.

Name	Description
Comm settings	Ethernet speed/duplex settings
	Default value: auto

# 5.2.2 Ethernet statistics page

Ethernet Link	Description	
Speed:	The current link speed.	
Duplex:	The current duplex configuration.	
Interface Counters	Description	
In Octets:	Received bytes.	
In Ucast Packets:	Received unicast packets.	
In NUcast packets:	Received non-unicast packets (broadcast and multicast).	
In Discards:	Received packets discarded due to no available memory buffers.	
In Errors:	Received packets discarded due to reception error.	
In Unknown Protos:	Received packets with unsupported protocol type.	
Out Octets:	Sent bytes.	
Out Ucast packets:	Sent unicast packets.	
Out NUcast packets:	Sent non-unicast packets (broadcast and multicast).	
Out Discards:	Outgoing packets discarded due to no available memory buffers.	
Out Errors:	Transmission errors.	
Media Counters	Description	
MAC RX Errors:	This counter is incremented for each packet received with errors. This count includes packets which are automatically rejected from the FIFO due to both wire errors and FIFO overruns.	
FCS Errors:	This counter is incremented for each packet received with a Frame Check Sequence error (bad CRC).	
Alignment Errors:	Packets with a invalid CRC on the last full octet, and an odd number of nibbles have been received (Dribble nibble condition with a bad CRC).	
Symbol Errors:	This counter is incremented for each packet received with one or more symbol errors detected.	
Frame Too Long:	This counter is incremented for each packet received with greater than the 802.3 standard maximum length of 1518 bytes.	
Transmission collisions:	This counter is incremented for each send packet that had a collision during transmis- sion.	
Runt Packets:	The size of the received packet was less than 64 bytes (inc. CRC).	
Packets received with collision:	The received packet had a collision during reception.	
Carrier Sense Lost:	Carrier sense was lost during transmission of a packet.	
Deferred transmissions:	Transmission of packet was deferred.	
Excessive Deferred transmis- sions:	The length of deferral during the transmission of the packet was excessive indicating transmission failure. The excessive deferral period is equal to 6144 bytes of data.	
Out of Windows Collision:	The MAC encountered an "out of window" collision during the transmission of a packet.	

The Ethernet statistics web page contains the following information:

# **5.3 Server Configuration**

### 5.3.1 General Information

#### Category: advanced

Basic web server configuration settings are stored in the system file '\http.cfg'. This file holds the root directory for the web interface, content types, and a list of file types which shall be scanned for SSI.

File Format:	Web Root Directory
[WebRoot]	The web server cannot access files outside this di- rectory.
[FileTypes]	Content Types
FileType1:ContentType1 FileType2:ContentType2	A list of file extensions and their reported content types.
 FileTypeN:ContentTypeN	See also
[SSIFileTypes]	- "Default Content Types" on page 25
FileType1 FileType2	-• SSI File Types
 FileTypeN	By default, only files with the extension 'shtm' are scanned for SSI. Additional SSI file types can be added here as necessary.

The web root directory determines the location of all files related to the web interface. Files outside of this directory and its sub-directories *cannot* be accessed by the web server.

#### 5.3.2 Index Page

The module searches for possible index pages in the following order:

- 1. <WebRoot>\index.htm
- 2. <WebRoot>\index.html
- 3. <WebRoot>\index.shtm
- **4.** <WebRoot>\index.wml

Note 1: Substitute <WebRoot> with the web root directory specified in '\http.cfg'.

Note 2: If no index page is found, the module will default to the virtual index file (if enabled).

See also ....

• "Default Web Pages" on page 20

### 5.3.3 Default Content Types

File Extension	Reported Content Type	
htm, html, shtm	text/html	
gif	image/gif	
jpeg, jpg, jpe	image/jpeg	
png	image/x-png	
js	application/x-javascript	
bat, txt, c, h, cpp, hpp	text/plain	
zip	application/x-zip-compressed	
exe, com	application/octet-stream	
wml	text/vnd.wap.wml	
wmlc	application/vnd.wap.wmlc	
wbmp	image/vnd.wap.wbmp	
wmls	text/vnd.wap.wmlscript	
wmlsc	application/vnd.wap.wmlscriptc	
xml	text/xml	
pdf	application/pdf	
CSS	text/css	

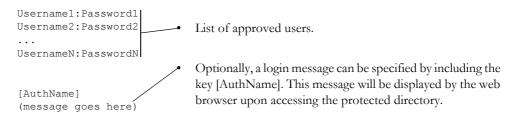

By default, the following content types are recognized by their file extension:

Content types can be added or redefined by adding them to the server configuration file, see 5-24 "General Information".

#### 5.3.4 Authorization

Directories can be protected from web access by placing a file called 'web\_accs.cfg' in the directory to protect. This file shall contain a list of users that are allowed to access the directory and its subdirectories.

File Format:

The list of approved users can optionally be redirected to one or several other files.

Example:

In this example, the list of approved users will be loaded from 'here.cfg' and 'too.cfg'.

```
[File path]
\i\put\some\over\here.cfg
\i\actually\put\some\of\it\here\too.cfg
[AuthName]
Howdy. Password, please.
```

# 6. E-mail Client

# 6.1 General Information

#### Category: extended

The built-in e-mail client allows the application to send e-mail messages through an SMTP-server. Messages can either be specified directly in the SMTP Client Object, or retrieved from the file system. The latter may contain SSI, however note that for technical reasons, certain commands cannot be used (specified separately for each SSI command).

The client supports authentication using the 'LOGIN' method. Account settings etc. are stored in the Network Configuration Object.

See also ....

- "Network Configuration Object (04h)" on page 72
- "SMTP Client Object (09h)" on page 96

# 6.2 How to Send E-mail Messages

To be able to send e-mail messages, the SMTP-account settings must be specified.

This includes...

- A valid SMTP-server address
- A valid username
- A valid password

To send an e-mail message, perform the following steps:

- 1. Create a new e-mail instance using the 'Create'-command (03h)
- 2. Specify the sender, recipient, topic and message body in the e-mail instance
- 3. Issue the 'Send Instance Email'-command (10h) towards the e-mail instance
- 4. Optionally, delete the e-mail instance using the 'Delete'-command (04h)

Sending a message based on a file in the file system is achieved using the 'Send Email from File'-command. For a description of the file format, see "Command Details: Send Email From File" on page 99.

# 7. Server Side Include (SSI)

# 7.1 General Information

#### Category: advanced

Server Side Include functionality, or SSI, allows data from files and objects to be represented on web pages and in e-mail messages.

SSI are special commands embedded within the source document. When the Anybus module encounters such a command, it will execute it, and replace it with the result specified operation (if applicable).

By default, only files with the extension 'shtm' are scanned for SSI.

# 7.2 Include File

This function includes the contents of a file. The content is scanned for SSI.

Note: This function cannot be used in e-mail messages.

Syntax:

```
<?--#include file="filename"-->
```

filename-Source file

Default Output:

Scenario	Default Output
Success	(contents of file)

# 7.3 Command Functions

### 7.3.1 General Information

Command functions executes commands and includes the result.

General Syntax:

<?--#exec cmd argument='command'-->

command-Command function, see below.

#### Command Functions:

| Command           | Valid for Email Messages | Page |
|-------------------|--------------------------|------|
| GetConfigItem()   | Yes                      | 29   |
| SetConfigItem()   | No                       | 30   |
| SsiOutput()       | Yes                      | 32   |
| DisplayRemoteUser | No                       | 32   |
| ChangeLanguage()  | No                       | 33   |
| IncludeFile()     | Yes                      | 34   |
| SaveDataToFile()  | No                       | 35   |
| printf()          | Yes                      | 36   |
| scanf()           | No                       | 38   |

### 7.3.2 GetConfigItem()

This command returns specific information from a file in the file system.

#### File Format:

The source file must have the following format:

[key1] value1 [key2] value2 ... [keyN] valueN

#### Syntax:

```
<?--exec cmd_argument='GetConfigItem("filename", "key"[,"separator"])'-->
filename-
filename-
Key - Source file to read from.
Key - Source [key] in file.
Continue and form is a base of the second form is a second form.
Source [key] in file.
Source [key] in file.
Source [key] in file.
```

separator- Optional; specifies line separation characters (e.g. "<br>"). (default is CRLF).

Default Output:

| Scenario             | Default Output                    |
|----------------------|-----------------------------------|
| Success              | (value of specified key)          |
| Authentication Error | "Authentication error "           |
| File open error      | "Failed to open file "filename" " |
| Key not found        | "Tag (key) not found "            |

#### Example:

The following SSI...

<?--exec cmd\_argument='GetConfigItem("\fruit.cnf", "Lemon")'-->

... in combination with the following file ('\fruit.cnf')...

[Apple] Green [Lemon] Yellow

[Banana] Blue

... returns the string 'Yellow'.

## 7.3.3 SetConfigItem()

This function stores an HTML-form as a file in the file system.

Note: This function cannot be used in e-mail messages.

Syntax:

| #exec cm</th <th><pre>id_argument='SetConfigItem("filename" [, Overwrite])'&gt;</pre></th> | <pre>id_argument='SetConfigItem("filename" [, Overwrite])'&gt;</pre>                                                                       |
|--------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| filename-                                                                                  | Destination file. If the specified file does not exist, it will be created (provided that the path is valid).                              |
| Overwrite                                                                                  | -Optional; forces the module to create a new file each time the command<br>is issued. The default behavior is to modify the existing file. |

File Format:

Each form object is stored as a [tag], followed by the actual value.

```
[form object name 1]
form object value 1
[form object name 2]
form object value 2
[form object name 3]
form object value 3
...
[form object name N]
form object value N
```

Note: Form objects with names starting with underscore ('\_') will not be stored.

#### Default Output:

| Scenario             | Default Output                                 |
|----------------------|------------------------------------------------|
| Success              | "Configuration stored to "filename""           |
| Authentication Error | "Authentication error "                        |
| File open error      | "Failed to open file "filename" "              |
| File write error     | "Could not store configuration to "filename" " |

#### Example:

The following example demonstrates how to use this function. The resulting page sends a form to itself, which is then evaluated by the SetConfigItem command.

```
<HTML>
<HEAD><TITLE>SetConfigItem Test</TITLE></HEAD>
<BODY>
<?--#exec cmd_argument='SetConfigItem("\food.txt")'-->
<FORM action="test.shtm">
 <P>
   <LABEL for="Name">Name: </LABEL><BR>
   <INPUT type="text" name="Name"><BR><BR>
   <LABEL for=" Age">Age: </LABEL><BR>
   <INPUT type="text" name=" Age"><BR><BR>
   <LABEL for="Food">Food: </LABEL><BR>
   <INPUT type="radio" name="Food" value="Cheese"> Cheese<BR>
   <INPUT type="radio" name="Food" value="Sausage"> Sausage<BR><BR>
   <LABEL for="Drink">Drink: </LABEL><BR>
   <INPUT type="radio" name="Drink" value="Wine"> Wine<BR>
   <INPUT type="radio" name="Drink" value="Beer"> Beer<BR><BR>
   <INPUT type="submit" name="_submit">
   <INPUT type="reset" name=" reset">
 </P>
</FORM>
</BODY>
</HTML>
```

The resulting file ('\food.txt') may look somewhat as follows:

```
[Name]
Cliff Barnes
[Food]
Cheese
[Drink]
Beer
```

Note: In order for this example to work, the HTML-file must be named 'test.shtm'.

### 7.3.4 SsiOutput()

This command temporarily modifies the SSI output of the following command function.

Syntax:

```
<?--#exec cmd argument='SsiOutput("success", "failure")'-->
```

success- String to use in case of success failure - String to use in case of failure

#### Default Output:

(this command produces no output on it's own)

Example:

The following example illustrates how to use this command.

```
<?--#exec cmd_argument='SsiOutput ("Parameter stored", "Error")'-->
<?--#exec cmd_argument='SetConfigItem("File.cfg", Overwrite)'-->
```

See also...

"SSI Output Configuration" on page 44

#### 7.3.5 DisplayRemoteUser

This command stores returns the username on an authentication session.

Note: This command cannot be used in e-mail messages.

Syntax:

<?--#exec cmd argument='DisplayRemoteUser'-->

Default Output:

| Scenario | Default Output |
|----------|----------------|
| Success  | (current user) |

## 7.3.6 ChangeLanguage()

This command changes the language setting based on an HTML form object.

Note: This command cannot be used in e-mail messages.

#### Syntax:

<?--#exec cmd\_argument='ChangeLanguage( "source" )'-->

source -Name of form object which contains the new language setting. The passed value must be a single digit as follows:

| Form value | Language |
|------------|----------|
| "0"        | English  |
| "1"        | German   |
| "2"        | Spanish  |
| "3"        | Italian  |
| "4"        | French   |

#### Default Output:

| Scenario | Default Output               |
|----------|------------------------------|
| Success  | "Language changed"           |
| Error    | "Failed to change language " |

#### Example:

The following example demonstrates how to use this function. The resulting page sends a form to itself, which is then evaluated by the ChangeLanguage() command.

Note: In order for this example to work, the HTML-file must be named 'test.shtm'.

### 7.3.7 IncludeFile()

This command includes the content of a file. Note that the content is not scanned for SSI.

Syntax:

```
<?--#exec cmd_argument='IncludeFile("filename" [, separator])'-->
filename-
separator-
Optional; specifies line separation characters (e.g. "<br>").
```

Default Output:

| Scenario             | Default Output                    |
|----------------------|-----------------------------------|
| Success              | (file contents)                   |
| Authentication Error | "Authentication error "           |
| File open error      | "Failed to open file "filename" " |

Example:

The following example demonstrates how to use this function.

```
<HTML>
<HEAD><TITLE>IncludeFile Test</TITLE></HEAD>
<BODY>
<H1> Contents of 'info.txt':</H1>
<P>
<?--#exec cmd_argument='IncludeFile("info.txt")'-->.
</P>
</BODY>
</HTML>
```

Contents of 'info.txt':

```
Neque porro quisquam est qui dolorem ipsum quia dolor sit amet, consectetur, adipisci velit...
```

When viewed in a browser, the resulting page should look somewhat as follows:

| 🕲 IncludeFile Test - Mozilla Firefox                                                        | _ 🗆 × |
|---------------------------------------------------------------------------------------------|-------|
| Ele Edit View Go Bookmarks Tools Help                                                       | 0     |
| (                                                                                           | Ļ     |
| Setting Started 🗟 Latest Headlines                                                          |       |
| Contents of 'info.txt':                                                                     |       |
| Veque porro quisquam est qui dolorem ipsum quia dolor sit amet, consectetur, adipisci velit |       |
| ······································                                                      |       |
|                                                                                             |       |
|                                                                                             |       |
|                                                                                             |       |
|                                                                                             |       |
|                                                                                             |       |
|                                                                                             |       |
|                                                                                             |       |

See also ....

• "Include File" on page 27

#### 7.3.8 SaveDataToFile()

This command stores data from an HTML-form as a file in the file system. Content from the different form objects are separated by a blank line (2\*CRLF).

Note 1: This command cannot be used in e-mail messages.

**Note 2:** The power to the module must not be recycled during the execution of this command. As there is no indication to confirm that the function has been fully executed, the function has to be used with care to avoid corruption of the file system.

Syntax:

| filename-           | Destination file. If the specified file does not exist, it will be created (provided that the path is valid).                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source -            | Optional; by specifying a form object, only data from that particular form object will be stored. Default behavior is to store data from all form objects except the ones where the name starts with underscore ('_'). |
| Overwrite   Append- | Specifies whether to overwrite or append data to existing files.                                                                                                                                                       |

Default Output:

| Scenario             | Default Output                                 |
|----------------------|------------------------------------------------|
| Success              | "Configuration stored to "filename" "          |
| Authentication Error | "Authentication error "                        |
| File write error     | "Could not store configuration to "filename" " |

Example:

The following example demonstrates how to use this function. The resulting page sends a form to itself, which is then evaluated by the SaveDataToFile command.

```
<html>
<head><TITLE>SaveDataToFile Test</TITLE></head>
<BODY>
<?--#exec cmd_argument='SaveDataToFile("\stuff.txt", "Meat", Overwrite)'-->
<FORM action="test.shtm">
 < P>
   <LABEL for="Fruit">Fruit: </LABEL><BR>
   <INPUT type="text" name="Fruit"><BR><BR>
   <LABEL for="Meat">Meat: </LABEL><BR>
   <INPUT type="text" name="Meat"><BR><BR>
   <LABEL for="Bread">Bread: </LABEL><BR>
   <INPUT type="text" name="Bread"><BR><BR>
   <INPUT type="submit" name=" submit">
 </P>
</FORM>
</BODY>
</HTML>
```

The resulting file ('\stuff.txt') will contain the value specified for the form object called 'Meat'. **Note:** In order for this example to work, the HTML-file must be named 'test.shtm'.

### 7.3.9 printf()

This function returns a formatted string which may contain data from the Anybus module and/or application. The formatting syntax used is similar to that of the standard C-function printf().

The function accepts a template string containing zero or more formatting tags, followed by a number of arguments. Each formatting tag corresponds to a single argument, and determines how that argument shall be converted to human readable form.

Syntax:

| #exec cmd_a</th <th><pre>argument='printf("template" [, argument1,, argumentN])'&gt;</pre></th> | <pre>argument='printf("template" [, argument1,, argumentN])'&gt;</pre>                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| template-                                                                                       | Template which determines how the arguments shall be represented. May<br>contain any number of formatting tags which are substituted by subse-<br>quent arguments and formatted as requested. The number of format tags<br>must match the number of arguments; if not, the result is undefined. |
|                                                                                                 | Formatting tags are written as follows:                                                                                                                                                                                                                                                         |
|                                                                                                 | %[Flags][Width][.Precision][Modifier]type                                                                                                                                                                                                                                                       |
|                                                                                                 | See also                                                                                                                                                                                                                                                                                        |
|                                                                                                 | "Formatting Tags" on page 37                                                                                                                                                                                                                                                                    |
| argument-                                                                                       | Source arguments; optional parameters which specify the actual source of<br>the data that shall be inserted in the template string. The number of argu-<br>ments must match the number of formatting tags; if not, the result is un-<br>defined.                                                |
|                                                                                                 | At the time of writing, the only allowed argument is ABCCMessage().                                                                                                                                                                                                                             |
|                                                                                                 | See also                                                                                                                                                                                                                                                                                        |
|                                                                                                 | • "ABCCMessage()" on page 40                                                                                                                                                                                                                                                                    |

Default Output:

| Scenario          | Default Output                           |
|-------------------|------------------------------------------|
| Success           | (printf() result)                        |
| ABCCMessage error | ABCCMessage error string (7-43 "Errors") |

### **Formatting Tags**

### • Type (Required)

The Type-character is required and determines the basic representation as follows:

| Type Character | Representation                                                                                                                                                   | Example  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| С              | Single character                                                                                                                                                 | b        |
| d, i           | Signed decimal integer.                                                                                                                                          | 565      |
| e, E           | Floating-point number in exponential notation.                                                                                                                   | 5.6538e2 |
| f              | Floating-point number in normal, fixed-point notation.                                                                                                           | 565.38   |
| g, G           | %e or %E is used if the exponent is less than -4 or greater than or equal to the precision; otherwise %f is used. Trailing zeroes/decimal point are not printed. | 565.38   |
| 0              | Unsigned octal notation                                                                                                                                          | 1065     |
| S              | String of characters                                                                                                                                             | Text     |
| u              | Unsigned decimal integer                                                                                                                                         | 4242     |
| х, Х           | Hexadecimal integer                                                                                                                                              | 4e7f     |
| %              | Literal %; no assignment is made                                                                                                                                 | %        |

#### • Flags (Optional)

| Flag Character | Meaning                                                                                                                                        |  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------|--|
| -              | Left-justify the result within the give width (default is right justification)                                                                 |  |
| +              | Always include a '+' or '-' to indicate whether the number is positive or negative                                                             |  |
| (space)        | If the number does not start with a '+' or '-', prefix it with a space character instead.                                                      |  |
| 0 (zero)       | Pad the field with zeroes instead of spaces                                                                                                    |  |
| #              | For %e, %E, and %f, forces the number to include a decimal point, even if no digits follow.<br>For %x and %X, prefixes 0x or 0X, respectively. |  |

#### • Width (Optional)

| Width  | Meaning                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| number | Specifies the minimum number of characters to be printed.                                                                                                            |
|        | If the value to be printed is shorter than this number, the result is padded to make up the field width. The result is never truncated even if the result is larger. |
| *      | The width is not specified in the format string, it is specified by an integer value preceding the argument that has to be formatted.                                |

#### • .Precision (Optional)

The exact meaning of this field depends on the type character:

| Type Character   | Meaning                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| d, i, o, u, x, X | Specifies the minimum no. of decimal digits to be printed. If the value to be printed is shorter than this number, the result is padded with space. Note that the result is never truncated, even if the result is larger. |
| e, E, f          | Specifies the no. of digits to be printed after the decimal point (default is 6).                                                                                                                                          |
| g, G             | Specifies the max. no. of significant numbers to be printed.                                                                                                                                                               |
| S                | Specifies the max. no. of characters to be printed                                                                                                                                                                         |
| С                | (no effect)                                                                                                                                                                                                                |

## • Modifier

| Modifier Character | Meaning                                                   |
|--------------------|-----------------------------------------------------------|
| h                  | Argument is interpreted as SINT8, SINT16, UINT8 or UINT16 |
| 1                  | Argument is interpreted as SINT32 or UINT32               |

# 7.3.10 scanf()

This function is very similar to the printf() function described earlier, except that it is used for input rather than output. The function reads a string passed from an HTML form object, parses the string as specified by a template string, and sends the resulting data to the specified argument. The formatting syntax used is similar to that of the standard C-function scanf().

The function accepts a source, a template string containing zero or more formatting tags, followed by a number of arguments. Each argument corresponds to a formatting tag, which determines how the data read from the HTML form shall be interpreted prior sending it to the destination argument.

Note: This command cannot be used in email messages.

Syntax:

| #exec cmd_a</th <th>rgument='scanf("<i>source"</i>, "<i>template</i>" [,<br/>argument1,, argumentN])'&gt;</th> | rgument='scanf(" <i>source"</i> , " <i>template</i> " [,<br>argument1,, argumentN])'>                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

May be given as decimal,<br>hexadecimal or octal, determined by the initial characters of the input data:<br><u>Initial Characters:Format:</u><br>0x Hexadecimal<br>0 Octal<br>1 9 Decimal                                                                                                                                     | SINT8/UINT8<br>SINT16/UINT16<br>SINT32/UINT32 |
| u                   | Accepts an optionally signed decimal integer.                                                                                                                                                                                                                                                                                                                                | UINT8<br>UINT16<br>UINT32                     |
| 0                   | Accepts an optionally signed octal integer.                                                                                                                                                                                                                                                                                                                                  | SINT8/UINT8<br>SINT16/UINT16<br>SINT32/UINT32 |
| х, Х                | Accepts an optionally signed hexadecimal integer.                                                                                                                                                                                                                                                                                                                            | SINT8/UINT8<br>SINT16/UINT16<br>SINT32/UINT32 |
| e, E,<br>f,<br>g, G | Accepts an optionally signed floating point number. The input format for float-<br>ing-point numbers is a string of digits, with some optional characteristics:<br>- It can be a signed value<br>- It can be an exponential value, containing a decimal rational number fol-<br>lowed by an exponent field, which consists of an 'E' or an 'e' followed by an<br>integer.    | FLOAT                                         |
| n                   | Consumes no input; the corresponding argument is an integer into which scanf writes the number of characters read from the object input.                                                                                                                                                                                                                                     | SINT8/UINT8<br>SINT16/UINT16<br>SINT32/UINT32 |
| S                   | Accepts a sequence of non-whitespace characters                                                                                                                                                                                                                                                                                                                              | STRING                                        |
| [scanset]           | Accepts a sequence of non-whitespace characters from a set of expected bytes specified by the scanlist (e.g '[0123456789ABCDEF]')<br>A literal ']' character can be specified as the first character of the set. A caret character (' $^{\Lambda}$ ) immediately following the initial '[' inverts the scanlist, i.e. allows all characters except the ones that are listed. | STRING                                        |
| %                   | Accepts a single '%' input at this point; no assignment or conversion is done.<br>The complete conversion specification should be '%%'.                                                                                                                                                                                                                                      | -                                             |

### • \* (Optional)

Data is read but ignored. It is not assigned to the corresponding argument.

#### • Width (Optional)

Specifies the maximum number of characters to be read.

#### • Modifier (Optional)

Specifies a different data size.

| Modifier | Meaning                        |
|----------|--------------------------------|
| h        | SINT8, SINT16, UINT8 or UINT16 |
|          | SINT32 or UINT32               |

# 7.4 Argument Functions

## 7.4.1 General Information

Argument functions are supplied as parameters to certain command functions.

General Syntax:

(Syntax depends on context)

Argument Functions:

| Function      | Description | Page |
|---------------|-------------|------|
| ABCCMessage() | -           | 40   |

# 7.4.2 ABCCMessage()

This function issues an object request towards an object in the module or in the host application.

#### Syntax:

| ABCCMessage(object, instance, command, ce0, ce1,<br>msgdata, c_type, r_type) |                                                                                         |  |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|--|
| object -                                                                     | Specifies the Destination Object                                                        |  |
| instance-                                                                    | Specifies the Destination Instance                                                      |  |
| command-                                                                     | Specifies the Command Number                                                            |  |
| <b>ce</b> 0 -                                                                | Specifies CmdExt[0] for the command message                                             |  |
| ce1 -                                                                        | Specifies CmdExt[1] for the command message                                             |  |
| msgdata- Specifi                                                             | es the actual contents of the MsgData[] subfield in the command                         |  |
|                                                                              | • Data can be supplied in direct form (format depends on c_type)                        |  |
|                                                                              | • The keyword "ARG" is used when data is supplied by the parent command (e.g. scanf()). |  |
| c_type -                                                                     | Specifies the data type in the command (msgdata)                                        |  |
| See also                                                                     |                                                                                         |  |
|                                                                              | • "Command Data Types (c_type)" on page 41                                              |  |
| r_type -                                                                     | Specifies the data type in the response (msgdata)                                       |  |
|                                                                              | See also                                                                                |  |
|                                                                              | • "Response Data Types (r_type)" on page 41                                             |  |

Numeric input can be supplied in the following formats:

| Decimal (e.g. 50)- | (no prefix)     |
|--------------------|-----------------|
| Octal (e.g. 043)-  | Prefix 0 (zero) |
| Hex (e.g. 0x1f)-   | Prefix 0x       |

#### • Command Data Types (c\_type)

For types which support arrays, the number of elements can be specified using the suffix '[n]', where 'n' specifies the number of elements. Each data element must be separated by space.

| Туре   | Supports Arrays | Data format (as supplied in msgdata)                                     |  |
|--------|-----------------|--------------------------------------------------------------------------|--|
| BOOL   | Yes             | 1                                                                        |  |
| SINT8  | Yes             | -25                                                                      |  |
| SINT16 | Yes             | 2345                                                                     |  |
| SINT32 | Yes             | -2569                                                                    |  |
| UINT8  | Yes             | 245                                                                      |  |
| UINT16 | Yes             | 40000                                                                    |  |
| UINT32 | Yes             | 32                                                                       |  |
| CHAR   | Yes             | Α                                                                        |  |
| STRING | No              | "abcde"                                                                  |  |
|        |                 | Note: Quotes can be included in the string if preceded by backslash('\') |  |
|        |                 | Example: "We usually refer to it as \"the Egg\" "                        |  |
| FLOAT  | Yes             | 5.6538e2                                                                 |  |
| NONE   | No              | Command holds no data, hence no data type                                |  |

#### • Response Data Types (r\_type)

For types which support arrays, the number of elements can be specified using the suffix '[n]', where 'n' specifies the number of elements.

| Type Supports Arrays |     | Comments                                                                                                                                                                                                                                                                                                         |  |
|----------------------|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| BOOL                 | Yes | Optionally, it is possible to exchange the BOOL data with a message<br>based on the value (true or false). In such case, the actual data type<br>returned from the function will be STRING.<br>Syntax: BOOL <true><false><br/>For arrays, the format will be BOOL[n]<true><false>.</false></true></false></true> |  |
| SINT8                | Yes | -                                                                                                                                                                                                                                                                                                                |  |
| SINT16               | Yes | -                                                                                                                                                                                                                                                                                                                |  |
| SINT32               | Yes | -                                                                                                                                                                                                                                                                                                                |  |
| UINT8                | Yes | This type can also be used when reading ENUM data types from an object. In such case, the actual ENUM value will be returned.                                                                                                                                                                                    |  |
| UINT16               | Yes | -                                                                                                                                                                                                                                                                                                                |  |
| UINT32               | Yes | -                                                                                                                                                                                                                                                                                                                |  |
| CHAR                 | Yes | -                                                                                                                                                                                                                                                                                                                |  |
| STRING               | No  | -                                                                                                                                                                                                                                                                                                                |  |
| ENUM                 | No  | When using this data type, the ABCCMessage() function will first read<br>the ENUM value. It will then issue a 'Get Enum String'-command to<br>retrieve the actual enumeration string. The actual data type in the<br>response will be STRING.                                                                    |  |
| FLOAT                | Yes | •                                                                                                                                                                                                                                                                                                                |  |
| NONE                 | No  | Response holds no data, hence no data type                                                                                                                                                                                                                                                                       |  |

**IMPORTANT:** It is important to note that the message will be passed transparently to the addressed object. The SSI engine performs no checks for violations of the object addressing scheme, e.g. a malformed Get\_Attribute request which (wrongfully) includes message data will be passed unmodified to the object, even though this is obviously wrong. Failure to observe this may cause loss of data or other undesired side effects.

Example (Get\_Attribute):

This example shows how to retrieve the IP address using printf() and ABCCMessage().

| Variable | Value    | Comments                           |  |
|----------|----------|------------------------------------|--|
| object   | 4        | Network Configuration Object (04h) |  |
| instance | 3        | Instance #3 (IP address)           |  |
| command  | 1        | Get_attribute                      |  |
| ce0      | 5        | Attribute #5                       |  |
| ce1      | 0        | -                                  |  |
| msgdata  | 0        | -                                  |  |
| c_type   | NONE     | Command message holds no data      |  |
| r_type   | UINT8[4] | Array of 4 unsigned 8-bit integers |  |

- 7-36 "printf()"

Example (Set\_Attribute):

This example shows how to set the IP address using scanf() and ABCCMessage(). Note the special parameter value 'ARG', which instructs the module to use the passed form data (parsed by scanf()).

| Variable | Value    | Comments                           |
|----------|----------|------------------------------------|
| object   | 4        | Network Configuration Object (04h) |
| instance | 3        | Instance #3 (IP address)           |

#### Errors

In case an object request results in an error, the error code in the response will be evaluated and translated to human readable form as follows:

| Error Code | Output                              |  |  |  |
|------------|-------------------------------------|--|--|--|
| 0          | "Unknown error"                     |  |  |  |
| 1          | "Unknown error"                     |  |  |  |
| 2          | "Invalid message format"            |  |  |  |
| 3          | "Unsupported object"                |  |  |  |
| 4          | "Unsupported instance"              |  |  |  |
| 5          | "Unsupported command"               |  |  |  |
| 6          | "Invalid CmdExt[0]"                 |  |  |  |
| 7          | "Invalid CmdExt[1]"                 |  |  |  |
| 8          | "Attribute access is not set-able"  |  |  |  |
| 9          | "Attribute access is not get-able"  |  |  |  |
| 10         | "Too much data in msg data field"   |  |  |  |
| 11         | "Not enough data in msg data field" |  |  |  |
| 12         | "Out of range"                      |  |  |  |
| 13         | "Invalid state"                     |  |  |  |
| 14         | "Out of resources"                  |  |  |  |
| 15         | "Segmentation failure"              |  |  |  |
| 16         | "Segmentation buffer overflow"      |  |  |  |
| 17 255     | "Unknown error"                     |  |  |  |

# 7.5 SSI Output Configuration

Optionally, the SSI output can be permanently changed by adding the file '\output.cfg'.

File format:

```
[ABCCMessage X]
0:"Success string"
                                            Each error code corresponds to a dedicated
1:"Error string 1"
                                            output string, labelled from 1 to 16.
2:"Error string 2"
. . .
                                            See also ....
16:"Error string 16"
                                             - "Errors" on page 43
[GetConfigItem X]
0:"Success string"
1:"Authentication error string"
2:"File open error string" -
                                           Use "//s" to include the name of the file.
                                   •
3:"Tag not found string" -
[SetConfigItem X]
0:"Success string" -
                                           Use "%s" to include the name of the file.
                                  \nearrow
1:"Authentication error string"
2:"File open error string"-
3:"File write error string"
[IncludeFile X]
0:"Success string" -
1:"Authentication error string" Use "%s" to include the name of the file.
2:"File readS error string" -
[scanf X]
0:"Success string"
1:"Parsing error string"
[ChangeLanguage X]
0:"Success string"
1:"Change error string"
```

All content above can be included in the file multiple times changing the value 'X' in each tag for different languages. The module will then select the correct output string based on the language settings. If no information for the selected language is found, it will use the default SSI output.

| Value of X | Language |
|------------|----------|
| 0          | English  |
| 1          | German   |
| 2          | Spanish  |
| 3          | Italian  |
| 4          | French   |

# 8. CIP Objects

# 8.1 General Information

This chapter specifies the CIP-object implementation in the module. These objects can be accessed from the network, but not directly by the host application.

Mandatory Objects:

- "Identity Object (01h)" on page 46
- "Message Router (02h)" on page 49
- "Assembly Object (04h)" on page 50
- "Connection Manager (06h)" on page 53
- "Parameter Object (0Fh)" on page 56
- "Port Object (F4h)" on page 60 (Optional)
- "TCP/IP Interface Object (F5h)" on page 62
- "Ethernet Link Object (F6h)" on page 65

Vendor Specific Objects:

• "ADI Object (A2h)" on page 58

It is possible to implement additional CIP-objects in the host application using the CIP forwarding functionality, see "EtherNet/IP Host Object (F8h)" on page 118 and "Command Details: Process\_CIP\_-Object\_Request" on page 121.

Unconnected CIP routing is supported, which means that a message can be sent to a device without first setting up a connection.

| 12 15  | (reserved)                                                                                                                                                                                                                                                                                                         |  |  |  |

a. This bit shows if the product has other settings than "out-of-box". The value is set to true if the configured attribute in the Application Object is set and/or the module's NV storage is changed from default.

b. See "Diagnostic Object (02h)" on page 70.

### Service Details: Reset Service

The module forwards reset requests from the network to the host application. For more information about network reset handling, consult the general Anybus CompactCom 30 Design Guide.

There are two types of network reset requests on EtherNet/IP:

#### • Type 0: 'Power Cycling Reset'

This service emulates a power cycling of the module, and corresponds to Anybus reset type 0 (Power cycling). For further information, consult the general Anybus CompactCom 30 Software Design Guide.

#### • Type 1: 'Out of box reset'

This service sets a "out of box" configuration and performs a reset, and corresponds to Anybus reset type 2 (Power cycling + factory default). For further information, consult the general Anybus CompactCom 30 Software Design Guide.

# 8.4 Assembly Object (04h)

## Category

Extended

## **Object Description**

The Assembly object uses static assemblies and holds the Process Data sent/received by the host application. The default assembly instance IDs used are in the vendor specific range.

See also ....

- "Process Data" on page 16
- "EtherNet/IP Host Object (F8h)" on page 118

## **Supported Services**

| Class:    | Get_Attribute_Single |
|-----------|----------------------|
| Instance: | Get_Attribute_Single |
|           | Set_Attribute_Single |

# **Class Attributes**

| # | Name         | Access | Туре | Value                     |
|---|--------------|--------|------|---------------------------|
| 1 | Revision     | Get    | UINT | 0002h (Object revision)   |
| 2 | Max Instance | Get    | UINT | (Highest instance number) |

## Instance 03h Attributes (Heartbeat, Input-Only)

#### Extended

This instance is used as heartbeat for Input-Only connections. The data size of the Heartbeat instance in the Forward\_Open-request should be 0 bytes, however other values are also permitted.

| # | Name | Access | Туре | Value                                       |
|---|------|--------|------|---------------------------------------------|
| 3 | Data | Set    | N/A  | - (The data size of this attribute is zero) |

The instance number for this instance can be changed by implementing the corresponding attribute in the EtherNet/IP Host Object.

### Instance 04h Attributes (Heartbeat, Listen-Only)

#### Extended

This instance is used as heartbeat for listen-only connections. The data size of the Heartbeat instance in the Forward\_Open-request should be 0 bytes, however other values are also permitted.

| # | Name | Access | Туре | Value                                       |
|---|------|--------|------|---------------------------------------------|
| 3 | Data | Set    | N/A  | - (The data size of this attribute is zero) |

The instance number for this instance can be changed by implementing the corresponding attribute in the EtherNet/IP Host Object.

#### Instance 05h Attributes (Configuration Data)

#### Extended

Configuration Data that is sent through the 'Forward\_Open'-service will be written to this instance.

| # | Name | Access  | Туре | Value                                                             |
|---|------|---------|------|-------------------------------------------------------------------|
| 3 | Data | Get/Set | N/A  | - (Configuration data written to the application when the forward |
|   |      |         |      | open command has the configuration data included)                 |

The instance number for this instance can be changed by implementing the corresponding attribute in the EtherNet/IP Host Object.

See also ...

• "Command Details: Set\_Configuration\_Data" on page 122

## Instance 06h Attributes (Heartbeat, Input-Only Extended)

#### Extended

This instance is used as heartbeat for input-only extended connections, and does not carry any attributes. The state of connections made to this instance does not affect the state of the Anybus CompactCom module, i.e. if the connection times out, the module does not switch to the Error state. The data size of the Heartbeat instance in the Forward\_Open-request should be 0 bytes, however other values are also permitted.

The instance number for this instance can be changed by implementing the corresponding attribute in the EtherNet/IP Host Object.

## Instance 07h Attributes (Heartbeat, Listen-Only Extended)

#### Extended

This instance is used as heartbeat for listen-only extended connections, and does not carry any attributes. The state of connections made to this instance does not affect the state of the Anybus CompactCom module, i.e. if the connection times out, the module does not switch to the Error state. The data size of

the Heartbeat instance in the Forward\_Open-request should be 0 bytes, however other values are also permitted.

The instance number for this instance can be changed by implementing the corresponding attribute in the EtherNet/IP Host Object.

## Instance 64h Attributes (Producing Instance)

#### Extended

The instance number for this instance can be changed by implementing the corresponding attribute in the EtherNet/IP Host Object.

| # | Name          | Access | Туре          | Value                                            |
|---|---------------|--------|---------------|--------------------------------------------------|
| 3 | Produced Data | Get    | Array of BYTE | This data corresponds to the Write Process Data. |

See also ...

# 8.5 Connection Manager (06h)

## Category

Extended

## **Object Description**

-

## **Supported Services**

Class:

Instance:

Forward\_Open Forward\_Close

## **Instance Descriptions**

(No supported instance attributes)

# **Class 1 Connection Details**

#### General

Class 1 connections are used to transfer I/O data, and can be established to instances in the Assembly Object. Each Class 1 connection will establish data transports; one consuming and up to four producing. The heartbeat instances can be used for connections that shall only access inputs. Class 1 connections use UDP transport.

- Total number of supported class 1 connections: 4
- Max input connection size: • 256 bytes Max output connection size: 256 bytes • 2... 3200ms Supported API: • • T->O Connection type: Point-to-point, Multicast Point-to-point • O->T Connection type: Supported trigger type: Cyclic •

#### **Connection Types**

#### • Exclusive-Owner connection

This type of connection controls the outputs of the Anybus module and does not depend on other connections.

1

Assembly Object, instance 96h (Default)

- Max. no. of Exclusive-Owner connections:
- Connection point  $O \Rightarrow T$ :
- Connection point  $T \Rightarrow O$ : Assembly Object, instance 64h (Default)

#### • Input-Only connection

This type of connection is used to read data from the Anybus module without controlling the outputs. It does not depend on other connections.

| - Max. no. of Input-Only connections:      | Up to 4 <sup>1</sup>                    |
|--------------------------------------------|-----------------------------------------|
| - Connection point $O \Rightarrow T$ :     | Assembly Object, instance 03h (Default) |
| - Connection point $T \Longrightarrow O$ : | Assembly Object, instance 64h (Default) |

**Note:** If an Exclusive-Owner connection has been opened towards the module and times out, the Input-Only connection times out as well. If the Exclusive-Owner connection is properly closed, the Input-Only connection remains unaffected.

#### Input-Only Extended connection

This connections functionality is the same as the standard Input-Only connection. However when this connection times out it does not affect the state of the application.

Connection point O ⇒ T: Assembly Object, instance 06h (Default)
 Connection point T ⇒ O: Assembly Object, instance 64h (Default)

#### Listen-Only connection

This type of connection requires another connection in order to exist. If that connection (Exclusive-Owner or Input-Only) is closed, the Listen-Only connection will be closed as well.

- Max. no. of Input-Only connections: Up to 4<sup>2</sup>
   Connection point O ⇒ T: Assembly Object, instance 04h (Default)
- Connection point  $T \Longrightarrow O$ : Assembly Object, instance 64h (Default)

#### Listen-Only Extended connection

This connections functionality is the same as the standard Listen-Only connection. However when this connection times out it does not affect the state of the application.

- Connection point  $O \Rightarrow T$ : Assembly Object, instance 07h (Default)
- Connection point  $T \Rightarrow O$ : Assembly Object, instance 64h (Default)

#### Redundant-Owner connection

This connection type is not supported by the module.

<sup>1.</sup> Shared with Exclusive-Owner and Listen-Only connections

<sup>2.</sup> Shared with Exclusive-Owner and Input-Only connections

# **Class 3 Connection Details**

#### • Explicit message connection

Class 3 connections are used to establish connections towards the message router. Thereafter, the connection is used for explicit messaging. Class 3 connections use TCP transport.

16

- No. of simultaneous Class 3 connections:
- Supported API:
- T->O Connection type:
- O->T Connection type:
- Supported trigger type:

Point-to-point Point-to-point Application

2 - 10000 ms

# 8.6 Parameter Object (0Fh)

### Category

Extended

### **Object Description**

This object allows configuration tools such as RSNetworx to extract information about the Application Data Instances (ADIs) and present them with their actual name and range to the user.

Since this process may be somewhat time consuming, especially when using the serial host interface, it is possible to disable support for this functionality in the EtherNet/IP Host Object.

Due to limitations imposed by the CIP standard, ADIs containing multiple elements (i.e. arrays etc.) cannot be represented through this object. In such cases, default values will be returned, see 8-57 "Default Values".

# 8.7 ADI Object (A2h)

### Category

Extended

## **Object Description**

This object maps instances in the Application Data Object to EtherNet/IP. All requests to this object will be translated into explicit object requests towards the Application Data Object in the host application; the response is then translated back to CIP-format and sent to the originator of the request.

See also ....

- Application Data Object (see Anybus CompactCom 30 Software Design Guide)
- "Parameter Object (0Fh)" on page 56 (CIP Object)

### **Supported Services**

Class: Get\_Attribute\_Single Instance: Get\_Attribute\_Single Set\_Attribute\_Single

## **Class Attributes**

| # | Name                | Access | Туре | Value                                                           |
|---|---------------------|--------|------|-----------------------------------------------------------------|
| 1 | Revision            | Get    | UINT | Object revision (Current value = 0001h)                         |
| 2 | Max Instance        | Get    | UINT | Equals attribute #4 in the Application Data Object <sup>a</sup> |
| 3 | Number of instances | Get    | UINT | Equals attribute #3 in the Application Data Object <sup>a</sup> |

a. Consult the general Anybus CompactCom 30 Software Design Guide for further information.

### **Instances Attributes**

Each instance corresponds to an instance within the Application Data Object (for more information, consult the general Anybus CompactCom 30 Software Design Guide).

| 8 | Entry Port              | Get    | UINT                                       | Returns the instance of the Port Object that describes the port through which this request entered the device.                                                                                                                                             |
| 9 | Port Instance Info      | Get    | Array of:                                  | Array of structures containing instance attributes 1 and 2 from<br>each instance. The array is indexed by instance number, up to<br>the maximum number of instances. The value at index 1 (off-<br>set 0) and any non-instantiated instances will be zero. |
|   |                         |        | Struct of:<br>UINT (Type)<br>UINT (Number) | Enumerates the type of port (see instance attribute #1)<br>CIP port number associated with this port (see instance #2)                                                                                                                                     |

# Instances Attributes (Instance #1)

#### Extended

This instance reflects the properties associated with the Ethernet interface.

| # | Name            | Access | Туре         | Value                                                                                                                          |
|---|-----------------|--------|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1 | Port Type       | Get    | UINT         | 0h (default)                                                                                                                   |
|   |                 |        |              | If one or more additional port instances are registered where<br>Port Type is not 0h, the value of this attribute shall be 4h. |
| 2 | Port Number     | Get    | UINT         | 2h                                                                                                                             |
| 3 | Link Object     | Get    | Struct of:   | -                                                                                                                              |
|   |                 |        | UINT         | 2h                                                                                                                             |
|   |                 |        | Padded EPATH | 20 F5 24 01h                                                                                                                   |
| 4 | Port Name       | Get    | SHORT_STRING | "EtherNet/IP"                                                                                                                  |
| 7 | Node Address    | Get    | Padded EPATH | -                                                                                                                              |
| 8 | Port Node Range | Get    | Struct of:   | -                                                                                                                              |
|   |                 |        | UINT (Min.)  |                                                                                                                                |
|   |                 |        | UINT (Max.)  |                                                                                                                                |

|    |         | RemoteMAC                          | ARRAY of 6 USINT  | -     | MAC address of remote node form the ARP PDU in which a conflict was detected.                                                                                                                                                                                                                                                                 |
|    |         | ArpPdu                             | ARRAY of 28 USINT | -     | Copy of the raw ARP PDU in which a con-<br>flict was detected.                                                                                                                                                                                                                                                                                |
| 12 | Set     | EIP QuickCon-<br>nect <sup>a</sup> | Bool              | 0     | Value:         Meaning:           0:         Disable EIP QuickConnect (Default)           1:         Enable EIP QuickConnect           If EIP QuickConnect is enabled, the Quick-Connect feature will direct EtherNet/IP target devices to quickly power up and join an EtherNet/IP network.                                                  |

a. If the module is configured to use EIP QuickConnect functionality, the EDS file has to be changed. As the EDS file is changed, the identity of the module has to be changed and the module will require certification, see "Conformance Test Guide" on page 10.

# 8.10 Ethernet Link Object (F6h)

# Category

Extended

# **Object Description**

This object groups diagnostic information for the Ethernet interface.

|   |        | In Octets                   | UDINT             | -         | Octets received on the interface                                                                         |
|   |        | In Ucast Packets            | UDINT             | -         | Unicast packets received on the interface                                                                |
|   |        | In NUcast Packets           | UDINT             | -         | Nonunicast packets received on the interface                                                             |
|   |        | In Discards                 | UDINT             | -         | Inbound packets with unknown protocol                                                                    |
|   |        | In Errors                   | UDINT             | -         | Inbound packets that contain errors (does not include discards)                                          |
|   |        | In Unknown Protos           | UDINT             | -         | Inbound packets with unknown protocol                                                                    |
|   |        | Out Octets                  | UDINT             | -         | Octets sent on the interface                                                                             |
|   |        | Out Ucast Packets           | UDINT             | -         | Unicast packets sent on the interface                                                                    |
|   |        | Out NUcast Packets          | UDINT             | -         | Nonunicast packets sent on the interface                                                                 |
|   |        | Out Discards                | UDINT             | -         | Outbound packets with unknown protocol                                                                   |
|   |        | Out Errors                  | UDINT             | -         | Outbound packets that contain errors (does not include discards)                                         |
| 5 | Get    | Media Counters              | Struct:           | 1         |                                                                                                          |
|   |        | Alignment Errors            | UDINT             | -         | Frames received that are not an integral num ber of octets in length                                     |
|   |        | FCS Errors                  | UDINT             | -         | Frames received that do not pass the FCS check                                                           |
|   |        | Single Collisions           | UDINT             | -         | Successfully transmitted frames which experi<br>enced exactly one collision                              |
|   |        | Multiple Collisions         | USINT             | -         | Successfully transmitted frames which experi<br>enced more than one collision                            |
|   |        | SQE Test Errors             | UDINT             | 0         | -                                                                                                        |
|   |        | Deferred Transmis-<br>sions | UDINT             | -         | Frames for which first transmission attempt is delayed because the medium is busy                        |
|   |        | Late Collisions             | UDINT             | -         | Number of times a collision is detected later<br>than 512 bit times into the transmission of a<br>packet |
|   |        | Excessive Collisions        | UDINT             | -         | Frames for which a transmission fails due to excessive collisions                                        |
|   |        | MAC Transmit<br>Errors      | UDINT             | -         | Frames for which transmission fails due to an internal MAC sublayer receive error                        |
|   |        | Carrier Sense<br>Errors     | UDINT             | -         | Times that the carrier sense condition was los<br>or never asserted when attempted to transmi<br>a frame |
|   |        | Frame Too Long              | UDINT             | -         | Frames received that exceed the maximum permitted frame size                                             |
|   |        | MAC Receive Errors          | UDINT             | -         | Frames for which reception on an interface fails due to an internal MAC sublayer receive error           |

| # | Access               | Name                      | Туре    | Value | Comments                                                                                                                 |
|---|----------------------|---------------------------|---------|-------|--------------------------------------------------------------------------------------------------------------------------|
| 6 | Get/Set <sup>a</sup> | Interface Control         | Struct: |       |                                                                                                                          |
|   |                      | Control Bits              | WORD    | -     | Interface control bits                                                                                                   |
|   |                      | Forced Interface<br>Speed | UINT    | -     | Speed at which the interface shall be forced to operate. Returns 'Object state Conflict' if auto-negotiation is enabled. |

a. Support for this attribute can be disabled by implementing attribute #9 in the EtherNet/IP Host Object.

## Interface Flags

| Bit                                            | Name        | Description                                                                                                  |
|------------------------------------------------|-------------|--------------------------------------------------------------------------------------------------------------|
| 0                                              | Link status | Indicates whether or not the Ethernet 802.3 communications interface is con-<br>nected to an active network. |
|                                                |             | Value:Meaning:<br>0 Inactive link                                                                            |
|                                                |             | 1 Active link                                                                                                |
| 1 Half/full duplex Indicates the duplex mo     |             | Indicates the duplex mode currently in use.                                                                  |
|                                                |             | Value:Meaning:                                                                                               |
|                                                |             | 0 Half duplex                                                                                                |
|                                                |             | 1 Full duplex                                                                                                |
| 2 - 4 Negotiation Status Indicates the stat    |             | Indicates the status of link auto-negotiation                                                                |

# 9. Anybus Module Objects

# 9.1 General Information

This chapter specifies the Anybus Module Object implementation and how they correspond to the functionality in the Anybus CompactCom 30 EtherNet/IP.

Standard Objects:

- "Anybus Object (01h)" on page 69
- "Diagnostic Object (02h)" on page 70
- "Network Object (03h)" on page 71
- "Network Configuration Object (04h)" on page 72

Network Specific Objects:

- "Socket Interface Object (07h)" on page 79
- "SMTP Client Object (09h)" on page 96
- "File System Interface Object (0Ah)" on page 101
- "Network Ethernet Object (0Ch)" on page 114
- "CIP Port Configuration Object (0Dh)" on page 115

# 9.2 Anybus Object (01h)

## Category

Basic

# **Object Description**

This object assembles all common Anybus data, and is described thoroughly in the general Anybus CompactCom 30 Software Design Guide.

# **Supported Commands**

Object: Get\_Attribute

Instance: Get\_Attribute Set\_Attribute Get\_Enum\_String

# **Object Attributes (Instance #0)**

(Consult the general Anybus CompactCom 30 Software Design Guide for further information.)

## **Instance Attributes (Instance #1)**

#### Basic

| #     | Name        | Access | Туре                                                                       | Value                                                                                      |
|-------|-------------|--------|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| 1     | Module type | Get    | UINT16                                                                     | 0401h (Standard Anybus CompactCom 30)                                                      |
| 2 11  | -           | -      | -                                                                          | Consult the general Anybus CompactCom 30<br>Software Design Guide for further information. |
| 12    | LED colors  | Get    | struct of:<br>UINT8(LED1A)<br>UINT8(LED1B)<br>UINT8(LED2A)<br>UINT8(LED2B) | Value:Color:<br>01h Green<br>02h Red<br>01h Green<br>02h Red                               |
| 13 16 | -           | -      | -                                                                          | Consult the general Anybus CompactCom 30<br>Software Design Guide for further information. |

# 9.3 Diagnostic Object (02h)

## **General Information**

Basic

# **Object Description**

This object provides a standardised way of handling host application events & diagnostics, and is thoroughly described in the general Anybus CompactCom 30 Software Design Guide.

#### **Supported Commands**

| Object:   | Get_Attribute |
|-----------|---------------|
|           | Create        |
|           | Delete        |
| Instance: | Get_Attribute |

## **Object Attributes (Instance #0)**

| #   | Name                 | Access | Data Type | Value                                                                                      |
|-----|----------------------|--------|-----------|--------------------------------------------------------------------------------------------|
| 1 4 | -                    | -      |           | Consult the general Anybus CompactCom 30 Software<br>Design Guide for further information. |
| 11  | Max no. of instances | Get    | UINT16    | 5+1                                                                                        |

### **Instance Attributes**

#### Basic

| # | Name       | Access | Туре  | Value                                             |
|---|------------|--------|-------|---------------------------------------------------|
| 1 | Severity   | Get    | UINT8 | Consult the general Anybus CompactCom 30 Software |
| 2 | Event Code | Get    | UINT8 | Design Guide for further information.             |

In this implementation, the severity level of all instances are combined (using logical 'OR') and represented on the network through the CIP Identity Object. The Event Code cannot be represented on the network and is thus ignored by the module.

# 9.5 Network Configuration Object (04h)

## Category

Extended, Advanced

# **Object Description**

This object holds network specific configuration parameters that may be set by the end user. A reset command (factory default) issued towards this object will result in all instances being set to their default values.

See also ....

- "Communication Settings" on page 15
- "TCP/IP Interface Object (F5h)" on page 62 (CIP-object)
- "Ethernet Link Object (F6h)" on page 65 (CIP-object)
- "E-mail Client" on page 26

**Note:** In order to ensure fieldbus conformance, the recommendations stated in the Anybus Compact-Com 30 Software Design Guide regarding this object must be followed.

## **Supported Commands**

| Object:   | Get_Attribute<br>Reset                            |
|-----------|---------------------------------------------------|
| Instance: | Get_Attribute<br>Set_Attribute<br>Get_Enum_String |

## **Object Attributes (Instance #0)**

(Consult the general Anybus CompactCom 30 Software Design Guide for further information.)

# Instance Attributes (Instance #3, IP Address)

Changes are valid after reset.

### Advanced

| # | Name               | Access  | Туре           | Description                                             |
|---|--------------------|---------|----------------|---------------------------------------------------------|
| 1 | Name <sup>a</sup>  | Get     | Array of CHAR  | 'IP address'                                            |
| 2 | Data type          | Get     | UINT8          | 04h (= UINT8)                                           |
| 3 | Number of elements | Get     | UINT8          | 04h (four elements)                                     |
| 4 | Descriptor         | Get     | UINT8          | 07h (read/write/shared access)                          |
| 5 | Value              | Get/Set | Array of UINT8 | Valid range: 0.0.0.0 255.255.255.255 (Default =0.0.0.0) |

a. Multilingual, see "Multilingual Strings" on page 78.

Example:

```
IP address: 10.10.12.13
(IP address byte #0, IP address byte #1, IP address byte #2, IP address byte #3)
```

# Instance Attributes (Instance #4, Subnet Mask)

Changes are valid after reset.

# 9.6 Socket Interface Object (07h)

# Category

Advanced

# **Object Description**

This object provides direct access to the TCP/IP stack socket interface, enabling custom protocols to be implemented over TCP/UDP.

Note that some of the commands used when accessing this object may require segmentation. For more information, see "Message Segmentation" on page 130.

**IMPORTANT:** The use of functionality provided by this object should only be attempted by users who are already familiar with socket interface programming and who fully understands the concepts involved in TCP/IP programming.

# **Supported Commands**

| Object:   | Get_Attribute                                                             |  |  |  |
|-----------|---------------------------------------------------------------------------|--|--|--|
|           | Create (See "Command Details: Create" on page 81)                         |  |  |  |
|           | Delete (See "Command Details: Delete" on page 82)                         |  |  |  |
| Instance: | Get_Attribute                                                             |  |  |  |
|           | Set_Attribute                                                             |  |  |  |
|           | Bind (See "Command Details: Bind" on page 83)                             |  |  |  |
|           | Shutdown (See "Command Details: Shutdown" on page 84)                     |  |  |  |

a. If the Keep alive attribute is set, the connection will be probed for the first time after it has been idle for 120 minutes. If a probe attempt fails, the connection will continue to be probed at intervals of 75 s. The connection is terminated after 8 failed probe attempts.

b. Must belong to group in order to get the loop backed message

c. Resolution is 50ms, i.e. 50...99 = 50ms, 100...149 = 100ms, 199 = 150ms etc.

# **Command Details: Delete**

#### Category

Advanced

### Details

Command Code.: 04h Valid for: Object Instance

#### Description

This command deletes a previously created socket and closes the connection (if connected).

- If the socket is of TCP-type and a connection is established, the connection is terminated with the RST-flag.
- To gracefully terminate a TCP-connection, it is recommended to use the 'Shutdown'-command (see "Command Details: Shutdown" on page 84) before deleting the socket, causing the connection to be closed with the FIN-flag instead.

# **Command Details: Shutdown**

#### Category

Advanced

#### Details

Command Code.: 11h Valid for: Instance

#### Description

This command closes a TCP-connection using the FIN-flag. Note that the response does not indicate if the connection actually shut down, which means that this command cannot be used to poll non-block-ing sockets, nor will it block for blocking sockets.

#### Command Details

| Field     | Contents                                                                                                                |  |
|-----------|-------------------------------------------------------------------------------------------------------------------------|--|
| CmdExt[0] | (reserved, set to zero)                                                                                                 |  |
| CmdExt[1] | Value:Mode:<br>00h Shutdown receive channel<br>01h Shutdown send channel<br>02h Shutdown both receive- and send channel |  |

#### Response Details

(no data)

The recommended sequence to gracefully shut down a TCP connection is described below.

Application initiates shutdown:

**1.** Send shutdown with CmdExt[1] set to 01h. This will send FIN-flag to host shutting down the send channel, note that the receive channel will still be operational.

**2.** Receive data on socket until error message Object specific error (EDESTADDRREQ (14)) is received, indicating that the host closed the receive channel. If host does not close the receive channel use a timeout and progress to step 3.

3. Delete the socket instance. If step 2 timed out, RST-flag will be sent to terminate the socket.

Host initiates shutdown:

**1.** Receive data on socket, if zero bytes received it indicates that the host closed the receive channel of the socket.

**2.** Try to send any unsent data to the host.

**3.** Send shutdown with CmdExt[1] set to 01h. This will send FIN-flag to host shutting down the receive channel.

4. Delete the socket instance.

# Category

Advanced

### Details

Command Code.: 12h Valid for: Instance

### Description

This command puts a TCP socket in listening state. Backlog queue length is the number of unaccepted connections allowed on the socket. When backlog queue is full, further connections will be refused with RST-flag.

# **Command Details: Accept**

#### Category

Advanced

### Details

Command Code.: 13h Valid for: Instance

### Description

This command accepts incoming connections on a listening TCP socket. A new socket instance is created for each accepted connection. The new socket is connected with the host and the response returns its instance number.

#### NON-BLOCKING mode:

This command must be issued repeatedly (polled) for incoming connections. If no incoming connection request exists, the module will respond with error code 0006h (EWOULDBLOCK).

#### BLOCKING mode:

This command will block until a connection request has been detected.

**Note:** This command will only be accepted if there is a free instance to use for accepted connections. For blocking connections, this command will reserve an instance.

# **Command Details: Connect**

#### Category

Advanced

#### Details

Command Code.: 14h Valid for: Instance

#### Description

For SOCK-DGRAM-sockets, this command specifies the peer with which the socket is to be associated (to which datagrams are sent and the only address from which datagrams are received).

For SOCK\_STREAM-sockets, this command attempts to establish a connection to a host.

SOCK\_STREAM-sockets may connect successfully only once, while SOCK\_DGRAM-sockets may use this service multiple times to change their association. SOCK-DGRAM-sockets may dissolve their association by connecting to IP address 0.0.0.0, port 0 (zero).

#### NON-BLOCKING mode:

This command must be issued repeatedly (polled) until a connection is connected, rejected or timed out. The first connect-attempt will be accepted, thereafter the command will return error code 22 (EINPROGRESS) on poll requests while attempting to connect.

### BLOCKING mode:

This command will block until a connection has been established or the connection request is cancelled due to a timeout or a connection error.

#### Response Details

# **Command Details: Receive**

#### Category

Advanced

#### Details

Command Code.: 15h Valid for: Instance

#### Description

This command receives data from a connected socket. Message segmentation may be used to receive up to 1472 bytes (see "Message Segmentation" on page 130).

For SOCK-DGRAM-sockets, the module will return the requested amount of data from the next received datagram. If the datagram is smaller than requested, the entire datagram will be returned in the response message. If the datagram is larger than requested, the excess bytes will be discarded.

For SOCK\_STREAM-sockets, the module will return the requested number of bytes from the received data stream. If the actual data size is less than requested, all available data will be returned.

#### NON-BLOCKING mode:

If no data is available on the socket, the error code 0006h (EWOULDBLOCK) will be returned.

#### BLOCKING mode:

The module will not issue a response until the operation has finished.

If the module responds successfully with 0 (zero) bytes of data, it means that the host has closed the connection. The send channel may however still be valid and must be closed using 'Shutdown' and/or 'Delete'.

# Command Details: Receive\_From

#### Category

Advanced

### Details

Command Code.: 16h Valid for: Instance

#### Description

This command receives data from an unconnected SOCK\_DGRAM-socket. Message segmentation may be used to receive up to 1472 bytes (see "Message Segmentation" on page 130).

The module will return the requested amount of data from the next received datagram. If the datagram is smaller than requested, the entire datagram will be returned in the response message. If the datagram is larger than requested, the excess bytes will be discarded.

The response message contains the IP address and port number of the sender.

#### NON-BLOCKING mode:

If no data is available on the socket, the error code 0006h (EWOULDBLOCK) will be returned.

#### BLOCKING mode:

The module will not issue a response until the operation has finished.

### **Command Details: Directory Read**

#### Category

Advanced

#### Details

Command Code.: 23h Valid for: Instance

#### Description

This command reads the contents of a directory previously opened for reading.

The command returns information about a single directory entry, which means that the command must be issued multiple times to retrieve the complete contents of a directory. When the last entry has been read, the command returns an "empty" response (i.e. a response where the data size is zero).

# 9.9 Network Ethernet Object (0Ch)

## Category

Extended

## **Object Description**

This object provides Ethernet-specific information to the application.

### **Supported Commands**

| Object:   | Get_Attribute |
|-----------|---------------|
| Instance: | Get_Attribute |

## **Object Attributes (Instance #0)**

| # | Name                 | Access | Data Type     | Value              |
|---|----------------------|--------|---------------|--------------------|
| 1 | Name                 | Get    | Array of CHAR | 'Network Ethernet' |
| 2 | Revision             | Get    | UINT8         | 01h                |
| 3 | Number of instances  | Get    | UINT16        | -                  |
| 4 | Highest instance no. | Get    | UINT16        | -                  |

## Instance Attributes (Instance #1)

#### Extended

| # | Name        | Access | Туре                                               | Description          |
|---|-------------|--------|----------------------------------------------------|----------------------|
| 1 | MAC Address | Get    | Array of UINT8                                     | Current MAC address. |
|   |             |        | See also "Ethernet Host Object (F9h)" on page 126) |                      |

## 9.10 CIP Port Configuration Object (0Dh)

### Category

Advanced

### **Object Description**

This object is used to populate and enumerate the CIP Port Object (see "Port Object (F4h)" on page 60) on the network side. Basically, this is a matter of creating and updating instances and attributes which shall represent a CIP Port within the host application. This process is necessary in case support for Unconnected CIP Routing has been enabled (see "EtherNet/IP Host Object (F8h)" on page 118, Instance Attribute #17).

Each instance within this object corresponds to an instance in the CIP Port Object. The object supports up to 8 instances, where instance #1 is dedicated to the local TCP port, enabling the host application to implement up to 7 additional ports. Instance #1 will automatically be populated with default values, however it is possible for the host application to customize instance attributes #2 and #4.

Apart from attribute #7, it is possible to write to the instance attributes only during setup. The host application is responsible for keeping instance attribute #7 updated for all ports located within the host application.

See also ....

- "Port Object (F4h)" on page 60 (CIP)
- "EtherNet/IP Host Object (F8h)" on page 118 (Instance Attribute #17)

**IMPORTANT:** Note that the module does not take over the host application responsibility for error control; the module will not verify that the data set by the host application is correct.

### **Supported Commands**

| Object:   | Get_Attribute                  |
|-----------|--------------------------------|
|           | Create                         |
|           | Delete                         |
| Instance: | Get_Attribute<br>Set_Attribute |

## **Object Attributes (Instance #0)**

| #  | Name                  | Access | Data Type     | Value                    |
|----|-----------------------|--------|---------------|--------------------------|
| 1  | Name                  | Get    | Array of CHAR | 'CIP Port Configuration' |
| 2  | Revision              | Get    | UINT8         | 01h                      |
| 3  | Number of instances   | Get    | UINT16        | -                        |
| 4  | Highest instance no.  | Get    | UINT16        | -                        |
| 11 | Max. no. of instances | Get    | UINT16        | 0008h                    |

| 1 | Port Type       | Set    | UINT16                                     | Enumerates the port (see CIP specification)                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2 | Port Number     | Set    | UINT16                                     | CIP port number associated with this port                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3 | Link Path       | Set    | Array of UINT8                             | Logical path segments which identify the object for this port.                                                                                                                                                                                                                                                                                                                                                                                          |
| 4 | Port Name       | Set    | Array of CHAR                              | String (max. no. of characters is 64) which names the port.                                                                                                                                                                                                                                                                                                                                                                                             |
| 5 | -               | -      | - (reserved)                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 6 | -               | -      | -                                          | (reserved)                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 7 | Node Address    | Set    | Array of UINT8                             | Node number of this device on port. The data type restricts<br>the range to a Port Segment. The encoded port number<br>must match the value specified in attribute #2.<br>A device which does not have a node number on the port<br>can specify a zero length node address within the Port Seg-<br>ment (i.e. 10h 00h).<br>In case the node address changes during runtime, the host<br>application is responsible for updating this attribute as well. |
| 8 | Port Node Range | Set    | Struct of:<br>UINT16 (Min)<br>UINT16 (Max) | Minimum and maximum node number on port.<br>Support for this attribute is conditional; the attribute shall be<br>supported provided that the node number can be reported<br>within the range of the data type (e.g. DeviceNet). If not (as<br>is the case with networks such as EtherNet/IP which uses a<br>4 byte IP address), the attribute shall not be supported.                                                                                   |

# **10. Host Application Objects**

## **10.1 General Information**

This chapter specifies the host application object implementation in the module. The objects listed here may optionally be implemented within the host application firmware to expand the EtherNet/IP implementation.

Standard Objects:

- Application Object (see Anybus CompactCom 30 Software Design Guide)
- Application Data Object (see Anybus CompactCom 30 Software Design Guide)

Network Specific Objects:

- "EtherNet/IP Host Object (F8h)" on page 118
- "Ethernet Host Object (F9h)" on page 126

## 10.2 EtherNet/IP Host Object (F8h)

### Category

Basic, extended, advanced

## **Object Description**

This object implements EtherNet/IP specific features in the host application. Note that this object must not be confused with the Ethernet Host Object, see "Ethernet Host Object (F9h)" on page 126.

The implementation of this object is optional; the host application can support none, some, or all of the attributes specified below. The module will attempt to retrieve the values of these attributes during startup; if an attribute is not implemented in the host application, simply respond with an error message (06h, "Invalid CmdExt[0]"). In such case, the module will use its default value.

If the module attempts to retrieve a value of an attribute not listed below, respond with an error message (06h, "Invalid CmdExt[0]").

Note that some of the commands used when accessing this object may require segmentation. For more information, see "Message Segmentation" on page 130.

#### Supported Commands

| Object: | Process_CIP_Object_Request<br>(See "Command Details: Process_CIP_Object_Request" on page 121)   |
|---------|-------------------------------------------------------------------------------------------------|
|         | Set_Configuration_Data<br>(See "Command Details: Set_Configuration_Data" on page 122)           |
|         | Process_CIP_Routing_Request<br>(See "Command Details: Process_CIP_Routing_Request" on page 124) |
|         | Get_Configuration_Data<br>(See "Command Details: Get_Configuration_Data" on page 125            |
|         |                                                                                                 |

Instance:

## **Object Attributes (Instance #0)**

| # | Name                 | Access | Data Type     | Value         |
|---|----------------------|--------|---------------|---------------|
| 1 | Name                 | Get    | Array of CHAR | 'EtherNet/IP' |
| 2 | Revision             | Get    | UINT8         | 02h           |
| 3 | Number of instances  | Get    | UINT16        | 0001h         |
| 4 | Highest instance no. | Get    | UINT16        | 0001h         |

## Instance Attributes (Instance #1)

#### Basic

| # | Name          | Access | Туре                                     | Default Value           | Comment                                                                                                  |
|---|---------------|--------|------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------------------|
| 1 | Vendor ID     | Get    | UINT16                                   | 005Ah                   | These values are forwarded to the Identity                                                               |
| 2 | Device Type   | Get    | UINT16                                   | 0000h                   | Object (CIP).                                                                                            |
| 3 | Product Code  | Get    | UINT16                                   | 0063h                   |                                                                                                          |
| 4 | Revision      | Get    | struct of:<br>UINT8 Major<br>UINT8 Minor | (software revision)     | See also<br>- "Device Customization" on page 13<br>- "Identity Object (01h)" on page 46 (CIP-<br>object) |
| 5 | Serial Number | Get    | UINT32                                   | (set at production)     | 00,000,                                                                                                  |
| 6 | Product Name  | Get    | Array of CHAR                            | 'Anybus-CC EtherNet/IP' | <b>Note:</b> Changing any of these attributes requires a new Vendor ID.                                  |

#### Extended

| 17 | Enable uncon-<br>nected routing | Get    | BOOL | False         | If true, the module enables unconnected CIP routing. This also triggers an initial upload of the contents of the CIP Port Mapping object.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 29 | Ignore Sequence<br>Count Check  | Get    | BOOL | False         | Setting this attribute to "true" makes the<br>module ignore the Sequence Count Check<br>for consumed Class 1 data.<br>This means that all data, not just changed/<br>new data, received from the Originator, will<br>be copied to the application.<br>Copying all data and not just changed data<br>is a violation of the CIP specification. It will<br>also affect the performance of the module.<br>Use precaution when setting this flag to<br>"true".<br>HMS will do NO performance measure-<br>ments and states NO guarantees about how<br>performance will be affected when copying |

### Command Details: Process\_CIP\_Object\_Request

#### Category

Advanced

#### Details

Command Code.: 10h Valid for: Object Instance

#### Description

By setting the 'Enable CIP Request Forwarding'-attribute (#11), all requests to unimplemented CIP-objects or unimplemented assembly object instances will be forwarded to the host application through this command. The application then has to evaluate the request and return a proper response. The module supports up to 6 pending CIP-requests; additional requests will be rejected by the module.

Note that since the telegram length on the host interface is limited, the request data size must not exceed 255 bytes. If it does, a the module will send a 'resource unavailable' response to the originator of the request and the message will not be forwarded to the host application.

**Note:** This command is similar - but <u>not</u> identical - to the 'Process\_CIP\_Request'-command in the Anybus CompactCom 30 DeviceNet.

• Command Details

| Field        | Contents          | Notes                                            |
|--------------|-------------------|--------------------------------------------------|
| CmdExt[0]    | CIP Service Code  | CIP service code from original CIP request       |
| CmdExt[1]    | Request Path Size | Number of 16-bit words in the Request Path field |
| MsgData[0 m] | Request Path      | CIP Padded EPATH (Class, Instance, Attr. etc.)   |
| MsgData[m n] | Request Data      | Service-specific data                            |

#### Response Details

| Field        | Contents                  | Notes                                             |
|--------------|---------------------------|---------------------------------------------------|
| CmdExt[0]    | CIP Service Code          | (Reply bit set)                                   |
| CmdExt[1]    | 00h                       | (reserved, set to zero)                           |
| MsgData[0]   | General Status            | CIP General Status Code                           |
| MsgData[1]   | Size of Additional Status | Number of 16-bit words in Additional Status array |
| MsgData[2 m] | Additional Status         | Additional Status, if applicable                  |
| MsgData[m n] | Response data             | Actual response data, if applicable               |

**IMPORTANT:** When using this functionality, make sure to implement the common CIP Class Attribute (attribute #1, 'Revision') for all objects in the host application firmware. Failure to observe this will prevent the module from successfully passing conformance tests.

### Command Details: Set\_Configuration\_Data

#### Category

Advanced

#### Details

Command Code.: 11h Valid for: Object Instance

#### Description

If the data segment in the CIP 'Forward\_Open' service contains Configuration Data, this will be forwarded to the host application through this command. If implemented, the host application should evaluate the request and return a proper response.

Since the telegram length on the host interface is limited, segmentation is needed for data sizes larger than 255 bytes. The maximum total amount of configuration data that will be accepted by the module is 458 bytes.

Note: This command must be implemented in order to support Configuration Data. If not implemented, the CIP 'Forward\_Open'-request will be rejected by the module.

#### • Command Details

| Field                       | Contents                   | Notes                                                     |
|-----------------------------|----------------------------|-----------------------------------------------------------|
| CmdExt[0]                   | -                          | (reserved, ignore)                                        |
| CmdExt[1]                   | Segmentation Control bits  | See "Message Segmentation" on page 141                    |
| MsgData[0 - 1] <sup>a</sup> | Producing connection point | Producing connection point, requested by the originator.  |
| MsgData[2 - 3] <sup>a</sup> | Consuming connection point | Consuming connecition point, requested by the originator. |
| MsgData[0 n]                | Data                       | Actual configuration data                                 |

a. MsgData[0 - 1]and MsgData[2 - 3] can both be 0. Normally, the Set\_Configuration\_Data command is sent to the application when an I/O connection is setup on the network. Producing connection point and consuming connection point are available and will be forwarded with the command. But if the configuration data originates from a set attribute single request or a not matching NULL forward open request, there is no information on the connection points and 0 (zero) will be forwarded to the application.

#### • Response Details (Success)

| Field     | Contents | Notes                   |
|-----------|----------|-------------------------|
| CmdExt[0] | 00h      | (reserved, set to zero) |
| CmdExt[1] | 00h      | (reserved, set to zero) |

• Response Details (Error)

| Field          | Contents            | Notes                                                                                                                              |
|----------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------|
| CmdExt[0]      | 00h                 | (reserved, set to zero)                                                                                                            |
| CmdExt[1]      | 00h                 | (reserved, set to zero)                                                                                                            |
| MsgData[0]     | Error code          | Anybus error code                                                                                                                  |
| MsgData[1]     | Extended error code | If the Anybus error code is set to FFh, the extended error code shall be translated as shown in "Extended Error Code" on page 123. |
| MsgData[2 - 3] | Index               | If the Extended error code is set to 02h (invalid configura-<br>tion), this parameter points to the attribute that failed.         |

#### **Extended Error Code**

If the Error code equals FFh (Object specific error), the extended code will be translated as below:

| Code | Contents                   | CIP no. | CIP status code            | Additional Information                                                                                                                                                                            |
|------|----------------------------|---------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01h  | Ownership con-<br>flict    | 01h     | Connection failure         | The configuration data was supplied in a forward open request.                                                                                                                                    |
|      |                            | 10h     | Device State con-<br>flict | The configuration data was supplied in a set request to the Assembly object.                                                                                                                      |
| 02h  | Invalid configura-<br>tion | 09h     | Bad attribute data         | CIP extended error code: Use value from MsgData[2 -<br>3]. The extended error code shall only be used if the<br>request originated from a Forward Open request, not<br>for explicit set requests. |

## Command Details: Process\_CIP\_Routing\_Request

#### Category

Advanced

#### Details

Command Code.: 12h Valid for: Object Instance

#### Description

The module will strip the first path within the Unconnected\_Send service and evaluate whether or not it's possible to continue with the routing (e.g. check that the requested port exists within the port object). If the stripped path was the last path the contents delivered to the application will be the CIP request sent to the destination node, otherwise it will be an Unconnected\_Send service with updated route path information.

The module supports up to 6 pending requests. Additional requests will be rejected by the module.

**Note:** Since the telegram length on the host interface is limited, the data must not exceed 255 bytes in length. If it does, the module will reject the originator of the request ('Resource unavailable'), and this command will not be issued towards the host application.

Command Details

| Field          | Contents         | Notes                                            |

### Command Details: Get\_Configuration\_Data

#### Details

Command Code.: 13h

Valid for: Object Instance

#### Description

If the configuration data is requested from the network, the Anybus will issue this command to the application. The application shall send the stored configuration data in the response message.

Since the telegram length on the host interface is limited, segmentation is needed for data sizes larger than 255 bytes. The maximum total amount of configuration data that will be accepted by the module is 458 bytes.

**Note:** This command must be implemented in order to support Configuration Data. If not implemented, the request will be rejected by the Anybus module.

#### Command Details

| Field        | Contents | Notes                    |
|--------------|----------|--------------------------|
| CmdExt[0]    | 00h      | -                        |
| CmdExt[1]    | 00h      | -                        |
| MsgData[0 n] | -        | No extended message data |

#### • Response Details (Success)

| Field          | Contents                  | Notes                                   |
|----------------|---------------------------|-----------------------------------------|
| CmdExt[0]      | 00h                       | (reserved, set to zero)                 |
| CmdExt[1]      | Segmentation Control bits | See "Message Segmentation" on page 130  |
| MsgData[0 - n] | Status                    | Configuration data from the application |

#### • Response Details (Error)

| Field      | Contents                  | Notes                                  |
|------------|---------------------------|----------------------------------------|
| CmdExt[0]  | 00h                       | (reserved, set to zero)                |
| CmdExt[1]  | Segmentation Control bits | See "Message Segmentation" on page 130 |
| MsgData[0] | Status                    | Anybus protocol error code             |

## 10.3 Ethernet Host Object (F9h)

## Category

Basic, extended

## **Object Description**

This object implements Ethernet features in the host application.

### **Supported Commands**

| Object:   | Get_Attribute                  |
|-----------|--------------------------------|
| Instance: | Get_Attribute<br>Set_Attribute |

## **Object Attributes (Instance #0)**

| # | Name                 | Access | Data Type     | Value      |
|---|----------------------|--------|---------------|------------|
| 1 | Name                 | Get    | Array of CHAR | 'Ethernet' |
| 2 | Revision             | Get    | UINT8         | 01h        |
| 3 | Number of instances  | Get    | UINT16        | 0001h      |
| 4 | Highest instance no. | Get    | UINT16        | 0001h      |

## Instance Attributes (Instance #1)

#### Basic

| # | Name                     | Access | Туре           | Default <sup>a</sup> | Comment                                                                                                                                      |
|---|--------------------------|--------|----------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | MAC address <sup>b</sup> | Get    | Array of UINT8 | -                    | 6 byte physical address value; overrides the pre-programmed Mac address. Note that the new Mac address value must be obtained from the IEEE. |

a. If an attribute is not implemented, the module will use this value instead

b. The module is pre-programmed with a valid Mac address. To use that address, do not implement this attribute.

#### Extended

| # | Name                  | Access | Туре   | Default <sup>a</sup> | Comment                                                                                                                    |
|---|-----------------------|--------|--------|----------------------|----------------------------------------------------------------------------------------------------------------------------|
| 2 | Enable HICP           | Get    | BOOL   | True                 | Value:Meaning:<br>True HICP enabled<br>False HICP disabled<br>(see "HICP (Host IP Configuration Protocol)"<br>on page 132) |
| 3 | Enable Web Server     | Get    | BOOL   | True                 | Value:Meaning:<br>True web server enabled<br>False web server disabled<br>(see "Web Server" on page 20)                    |
| 5 | Enable Web ADI access | Get    | BOOL   | True                 | Value:Meaning:<br>True web ADI access enabled<br>False web ADI access disabled<br>(see "Web Server" on page 20)            |
| 6 | Enable FTP server     | Get    | BOOL   | True                 | Value:Meaning:<br>True FTP server enabled<br>False FTP server disabled<br>(see "FTP Server" on page 18)                    |
| 7 | Enable admin mode     | Get    | BOOL   | False                | Value:Meaning:<br>True FTP Admin mode enabled<br>False FTP Admin mode disabled<br>(see "FTP Server" on page 18)            |
| 8 | Network Status        | Set    | UINT16 | -                    | See "Network Status" on page 127                                                                                           |

a. If an attribute is not implemented, the module will use this value instead

### **Network Status**

This attribute holds a bit field which indicates the overall network status as follows:

| Bit  | Contents       | Description                                                                       |
|------|----------------|-----------------------------------------------------------------------------------|
| 0    | Link           | Value:Meaning:<br>True Link sensed                                                |
|      |                | False No link                                                                     |
| 1    | IP established | Value:Meaning:<br>True IP address established<br>False IP address not established |
| 2 15 | (reserved)     | (mask off and ignore)                                                             |

# A. Categorization of Functionality

The objects, including attributes and services, of the Anybus CompactCom and the application are divided into three categories: basic, advanced and extended.

## A.1 Basic

This category includes objects, attributes and services that are mandatory to implement or to use. They will be enough for starting up the Anybus CompactCom and sending/receiving data with the chosen network protocol. The basic functions of the industrial network are used.

Additional objects etc, that will make it possible to certify the product also belong to this category.

## A.2 Extended

Use of the objects in this category extends the functionality of the application. Access is given to the more specific characteristics of the industrial network, not only the basic moving of data to and from the network. Extra value is given to the application.

# A.3 Advanced

The objects, attributes and services that belong to this group offer specialized and/or seldom used functionality. Most of the available network functionality is enabled and accessible. Access to the specification of the industrial network is normally required.

# **B. Implementation Details**

## **B.1 SUP-Bit Definition**

The supervised bit (SUP) indicates that the network participation is supervised by another network device. In the case of EtherNet/IP, this means that the SUP-bit is set when one or more CIP (Class 1 or Class 3) connections has been opened towards the module.

## **B.2 Anybus State Machine**

The table below describes how the Anybus State Machine relates to the EtherNet/IP network.

| Anybus State   | Implementation                                                                                                           | Comment                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| WAIT_PROCESS   | The module stays in this state until a Class 1 connection has been opened.                                               | -                                                             |
| ERROR          | <ol> <li>Class 1 connections errors</li> <li>Duplicate IP address detected</li> </ol>                                    | -                                                             |
| PROCESS_ACTIVE | Error free Class 1 connection active (RUN-bit set<br>in the 32-bit Run/Idle header of an Exclusive-<br>Owner connection) | Only valid for consuming connections.                         |
| IDLE           | Class 1 connection idle.                                                                                                 | -                                                             |
| EXCEPTION      | Unexpected error, e.g. watchdog timeout etc.                                                                             | MS LED turns red (to indicate a major fault)<br>NS LED is off |

## **B.3 Application Watchdog Timeout Handling**

Upon detection of an application watchdog timeout, the module will cease network participation and shift to state 'EXCEPTION'. No other network specific actions are performed.

# C. Message Segmentation

## C.1 General

#### Category: Advanced

The maximum message size supported by the Anybus CompactCom 30 is 255 bytes. To provide support for longer messages (needed when using the socket interface), a segmentation protocol is used.

The segmentation protocol is implemented in the message layer and must not be confused with the fragmentation used on the serial host interface. Consult the general Anybus CompactCom 30 Software Design Guide for further information.

The module supports 1 (one) simultaneous segmented message per instance.

## **C.2 Command Segmentation**

When a command message is segmented, the command initiator sends the same command header multiple times. For each message, the data field is exchanged with the next data segment.

Please note that some commands can't be used concurrently on the same instance, since they both need access to the segmentation buffer for that instance.

Command segmentation is used for the following commands:

- Set\_Configuration\_Data (see "Command Details: Set\_Configuration\_Data" on page 122)
- Send (see "Command Details: Send" on page 90)
- Send To (see "Command Details: Send\_To" on page 91)

#### Segmentation Control bits (Command)

| Bit | Contents   | Meaning                                         |  |
|-----|------------|-------------------------------------------------|--|
| 0   | FS         | Set if the current segment is the first segment |  |
| 1   | LS         | Set if the current segment is the last segment  |  |
| 2   | AB         | Set if the segmentation shall be aborted        |  |
| 37  | (reserved) | Set to 0 (zero)                                 |  |

#### Segmentation Control bits (Response)

| Bit | Contents   | Meaning |
|-----|------------|---------|
| 07  | (reserved) | Ignore  |

When issuing a segmented command, the following rules apply:

- When issuing the first segment, FS must be set.
- When issuing subsequent segments, both FS and LS must be cleared.
- When issuing the last segment, the LF-bit must be set.
- For single segment commands (i.e. size less or equal to 255 bytes), both FS and LS must be set.
- The last response message contains the actual result of the operation.
- The command initiator may at any time abort the operation by issuing a message with AB set.

If a segmentation error is detected during transmission, an error message is returned, and the current segmentation message is discarded. Note however that this only applies to the current segment; previously transmitted segments are still valid.

## C.3 Response Segmentation

When a response is segmented, the command initiator requests the next segment by sending the same command multiple times. For each response, the data field is exchanged with the next data segment.

Response segmentation is used for responses to the following commands:

- Receive (object specific, see "Command Details: Receive" on page 88)
- Receive From (object specific, see "Command Details: Receive\_From" on page 89)
- Get\_Configuration\_Data (see "Command Details: Get\_Configuration\_Data" on page 125)

#### Segmentation Control bits (Command)

| Bit | Contents   | Meaning                                  |  |
|-----|------------|------------------------------------------|--|
| 0   | (reserved) | (set to zero)                            |  |
| 1   |            |                                          |  |
| 2   | AB         | Set if the segmentation shall be aborted |  |
| 37  | (reserved) | (set to zero)                            |  |

#### Segmentation Control bits (Response)

| Bit | Contents   | Meaning                                         |
|-----|------------|-------------------------------------------------|
| 0   | FS         | Set if the current segment is the first segment |
| 1   | LS         | Set if the current segment is the last segment  |
| 27  | (reserved) | (set to zero)                                   |

When receiving a segmented response, the following rules apply:

- In the first segment, FS is set
- In all subsequent segment, both FS and LS are cleared
- In the last segment, LS is set
- For single segment responses (i.e. size less or equal to 255 bytes), both FS and LS are set.
- The command initiator may at any time abort the operation by issuing a message with AB set.

# **D. HICP (Host IP Configuration Protocol)**

## **D.1 General**

The module supports the HICP protocol used by the Anybus IPconfig utility for changing settings, e.g. IP address, Subnet mask, and enable/disable DHCP. Anybus IPconfig can be downloaded free of charge from the HMS website, www.anybus.com. This utility may be used to access the network settings of any Anybus product connected to the network via UDP port 3250.

## **D.2 Operation**

Upon starting the program, the network is scanned for Anybus products. The network can be rescanned at any time by clicking 'Scan'.

| Ethernet configuratio<br>IP address: |       | - | 10  | - | 12  | - | 246  | DHCP            |
|--------------------------------------|-------|---|-----|---|-----|---|------|-----------------|
| II 0001633.                          |       |   | 10  |   |     |   | 2.10 | C On            |
| Subnet mask:                         | 255   |   | 255 |   | 255 |   | 0    | , C On          |
|                                      |       |   |     |   |     |   |      | Off             |
| Default gateway:                     | 0     |   | 0   |   | 0   |   | 0    |                 |
|                                      |       |   |     |   |     |   |      |                 |
| Primary DNS:                         | 0     |   | 0   |   | 0   |   | 0    |                 |
| Secondary DNS:                       | 0     |   | 0   |   | 0   |   | 0    |                 |
| secondary onto:                      |       |   |     |   |     |   |      |                 |
| lostname:                            | homer |   | _   |   |     |   | _    |                 |
|                                      |       |   |     |   |     |   |      |                 |
| Password:                            |       |   |     |   |     |   |      | Change password |
| New password:                        |       | _ |     | _ |     | _ |      |                 |
| vew password.                        | 1     |   |     |   |     |   |      |                 |
|                                      |       |   |     |   |     |   |      | Set Cancel      |
|                                      |       |   |     |   |     |   |      | 001081          |

To alter the network settings of the module, doubleclick on its entry in the list. A window will appear, containing the settings for the module.

Validate the new settings by clicking 'Set', or click 'Cancel' to cancel all changes.

Optionally, the configuration can be protected from unauthorized access by a password. To enter a password, click on the 'Change password' checkbox, and enter the password under 'New password'.

# **E. Technical Specification**

## **E.1 Front View**

| # | Item               |  |
|---|--------------------|--|
| 1 | Network Status LED |  |
| 2 | Module Status LED  |  |
| 3 | Link/Activity      |  |
| 4 | Ethernet Interface |  |

#### **Network Status LED**

Note: A test sequence is performed on this LED during startup.

| LED State       | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| Off             | No power or no IP address                                       |
| Green           | On-line, one or more connections established (CIP Class 1 or 3) |
| Green, flashing | On-line, no connections established                             |
| Red             | Duplicate IP address, FATAL error                               |
| Red, flashing   | One or more connections timed out (CIP Class 1 or 3)            |

#### **Module Status LED**

Note: A test sequence is performed on this LED during startup.

| LED State       | Description                                     |  |  |
|-----------------|-------------------------------------------------|--|--|
| Off             | No power                                        |  |  |
| Green           | Controlled by a Scanner in Run state            |  |  |
| Green, flashing | Not configured, or Scanner in Idle state        |  |  |
| Red             | Major fault (EXCEPTION-state, FATAL error etc.) |  |  |
| Red, flashing   | Recoverable fault(s)                            |  |  |

#### LINK/Activity LED

| LED State         | Description          |
|-------------------|----------------------|
| Off               | No link, no activity |
| Green             | Link established     |
| Green, flickering | Activity             |

#### **Ethernet Interface**

The Ethernet interface supports 10/100Mbit, full or half duplex operation.

## E.2 Protective Earth (PE) Requirements

In order to ensure proper EMC behaviour, the module must be properly connected to protective earth via the PE pad / PE mechanism described in the general Anybus CompactCom 30 Hardware Design Guide.

HMS Industrial Networks does not guarantee proper EMC behaviour unless these PE requirements are fulfilled.

## E.3 Power Supply

#### **Supply Voltage**

The module requires a regulated 3.3V power source as specified in the general Anybus CompactCom 30 Hardware Design Guide.

#### **Power Consumption**

The Anybus CompactCom 30 EtherNet/IP is designed to fulfil the requirements of a Class A module. For more information about the power consumption classification used on the Anybus CompactCom platform, consult the general Anybus CompactCom 30 Hardware Design Guide.

The current hardware design consumes up to 200mA<sup>1</sup>.

## **E.4 Environmental Specification**

Consult the Anybus CompactCom 30 Hardware Design Guide for further information.

## **E.5 EMC Compliance**

Consult the Anybus CompactCom 30 Hardware Design Guide for further information.

<sup>1.</sup> Note that in line with HMS policy of continuous product development, we reserve the right to change the exact power requirements of this product without prior notification. Note however that in any case, the Anybus CompactCom 30 EtherNet/IP will remain as a Class A module.

# F. Timing & Performance

# **F.1 General Information**

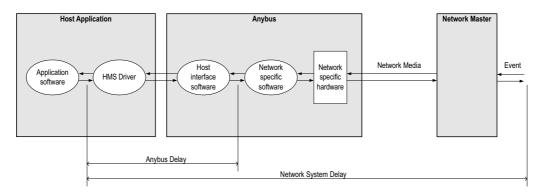

This chapter specifies timing and performance parameters that are verified and documented for the Anybus CompactCom 30 EtherNet/IP w. IT Functionality.

The following timing aspects are measured:

| Category                                                       | Parameters    | Page                           |
|----------------------------------------------------------------|---------------|--------------------------------|
| Startup Delay                                                  | T1, T2        | Please consult the Anybus Com- |
| NW_INIT Delay                                                  | Т3            | pactCom 30 Software Design     |
| Telegram Delay                                                 | T4            | Guide, App. B.                 |
| Command Delay                                                  | T5            |                                |
| Anybus Read Process Data Delay (Anybus Delay)                  | T6, T7, T8    |                                |
| Anybus Write Process Data Delay (Anybus Delay)                 | T12, T13, T14 |                                |
| Network System Read Process Data Delay (Network System Delay)  | T9, T10, T11  | 137                            |
| Network System Write Process Data Delay (Network System Delay) | T15, T16, T17 | 137                            |

## F.2 Process Data

### F.2.1 Overview

## F.2.2 Anybus Read Process Data Delay (Anybus Delay)

The Read Process Data Delay (labelled 'Anybus delay' in the figure above) is defined as the time measured from just before new data is buffered and available to the Anybus host interface software, to when the data is available to the host application (just after the new data has been read from the driver).

Please consult the Anybus CompactCom 30 Software Design Guide, Appendix B, for more information.

## F.2.3 Anybus Write Process Data Delay (Anybus Delay)

The Write Process Data Delay (labelled 'Anybus delay' in the figure) is defined as the time measured from the point the data is available from the host application (just before the data is written from the host application to the driver), to the point where the new data has been forwarded to the network buffer by the Anybus host interface software.

Please consult the Anybus CompactCom 30 Software Design Guide, Appendix B, for more information.

## F.2.4 Network System Read Process Data Delay (Network System Delay)

The Network System Read Process Data Delay (labelled 'Network System Delay in the figure), is defined as the time measured from the point where an event is generated at the network master to when the corresponding data is available to the host application (just after the corresponding data has been read from the driver).

| Parameter | Description                                                    | Тур. | Avg. | Max. | Unit. |
|-----------|----------------------------------------------------------------|------|------|------|-------|
| Т9        | Network System Read Process Data delay, 8 ADIs (single UINT8)  | 8.7  | 5.9  | 11.0 | ms    |
| T10       | Network System Read Process Data delay, 16 ADIs (single UINT8) | 8.8  | 6.0  | 11.0 | ms    |
| T11       | Network System Read Process Data delay, 32 ADIs (single UINT8) | 9.0  | 6.0  | 11.0 | ms    |

#### **Conditions:**

| Parameter                                                           | Conditions        |  |  |
|---------------------------------------------------------------------|-------------------|--|--|
| Application CPU                                                     | -                 |  |  |
| Timer system call interval                                          | 1 ms              |  |  |
| Driver call interval                                                | 0.2 0.3 ms        |  |  |
| No.of ADIs (single UINT8) mapped to Process Data in each direction. | 8, 16 and 32      |  |  |
| Communication                                                       | Parallel          |  |  |
| Telegram types during measurement period                            | Process Data only |  |  |
| Bus load, no. of nodes, baud rate etc.                              | Normal            |  |  |

### F.2.5 Network System Write Process Data Delay (Network System Delay)

The Network System Write Process Data Delay (labelled 'Network System Delay in the figure), is defined as the time measured from the time after the new data is available from the host application (just before the data is written to the driver) to when this data generates a corresponding event at the network master.

| Parameter | Description                                                     | Тур. | Avg. | Max. | Unit. |
|-----------|-----------------------------------------------------------------|------|------|------|-------|
| T15       | Network System Write Process Data delay, 8 ADIs (single UINT8)  | 8.7  | 5.9  | 11.0 | ms    |
| T16       | Network System Write Process Data delay, 16 ADIs (single UINT8) | 8.8  | 6.0  | 11.0 | ms    |
| T17       | Network System Write Process Data delay, 32 ADIs (single UINT8) | 9.0  | 6.0  | 11.0 | ms    |

Conditions: as in "Network System Read Process Data Delay (Network System Delay)" on page 137.

# G. Key Numbers

| Item                                                   | Ethernet/IP | Section              | Page |
|--------------------------------------------------------|-------------|----------------------|------|
| Network Data Format                                    | LSB first   | Network Object (03h) | 71   |
| Acyclic Data Support                                   | Yes         |                      |      |
| Max. no. of Elements Per ADI                           | 255         |                      |      |
| Max. ADI Size (in bytes)                               | 255         |                      |      |
| Lowest Addressable ADI no.                             | 1           |                      |      |
| Highest Addressable ADI no.                            | 65535       |                      |      |
| Max. Process Data (Read + Write, in bytes)             | 512         |                      |      |
| Min. Process Data (Read + Write, in bytes)             | 0           |                      |      |
| Max. Write Process Data (in bytes)                     | 256         |                      |      |
| Min. Write Process Data (in bytes)                     | 0           |                      |      |
| Max. Read Process Data (in bytes)                      | 256         |                      |      |
| Min. Read Process Data (in bytes)                      | 0           |                      |      |
| Requires 'Get/Set_Indexed_Attribute'                   | No          |                      |      |
| Requires 'Get_Instance_Num-<br>ber_By_Order'           | Yes         |                      |      |
| Max. no. of Diagnostic Instances                       | 6           |                      |      |
| Supports Network Reset Type 0: 'Power-on reset'        | Yes         |                      |      |
| Supports Network Reset Type 1: 'Factory default reset' | Yes         |                      |      |
| Supports SINT64                                        | Yes         |                      |      |
| Supports UINT64                                        | Yes         |                      |      |
| Supports FLOAT                                         | Yes         |                      |      |
