

## Step 1: Install the GSDML file of the SFB-PN in the configuration software (TIA / STEP 7)

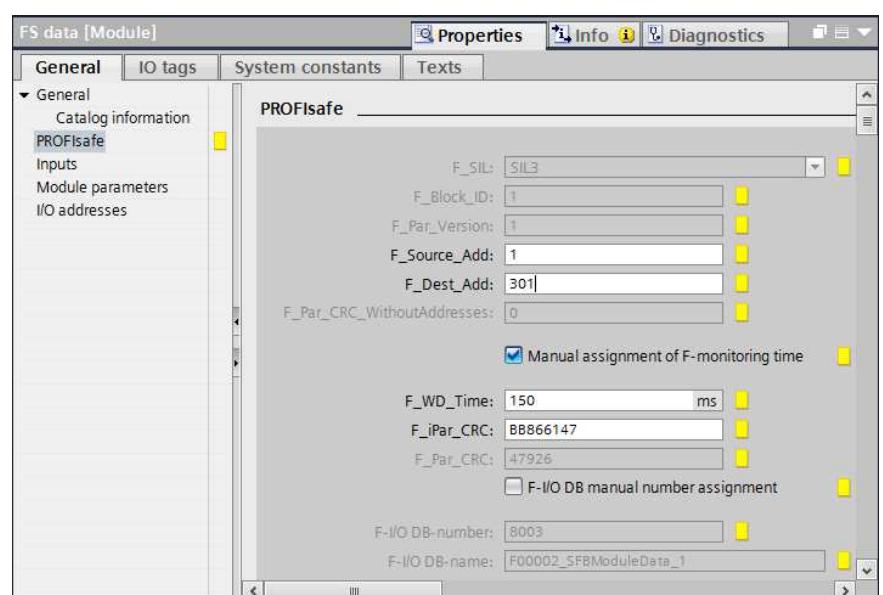

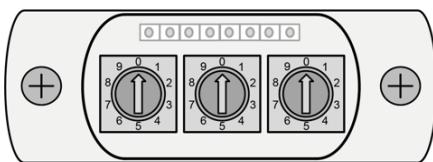

## Step 2: Add the SFB-PN module to the hardware configuration

## Step 3: Configuring SFB-PN in the PROFINET network (IP address & PROFINET name)

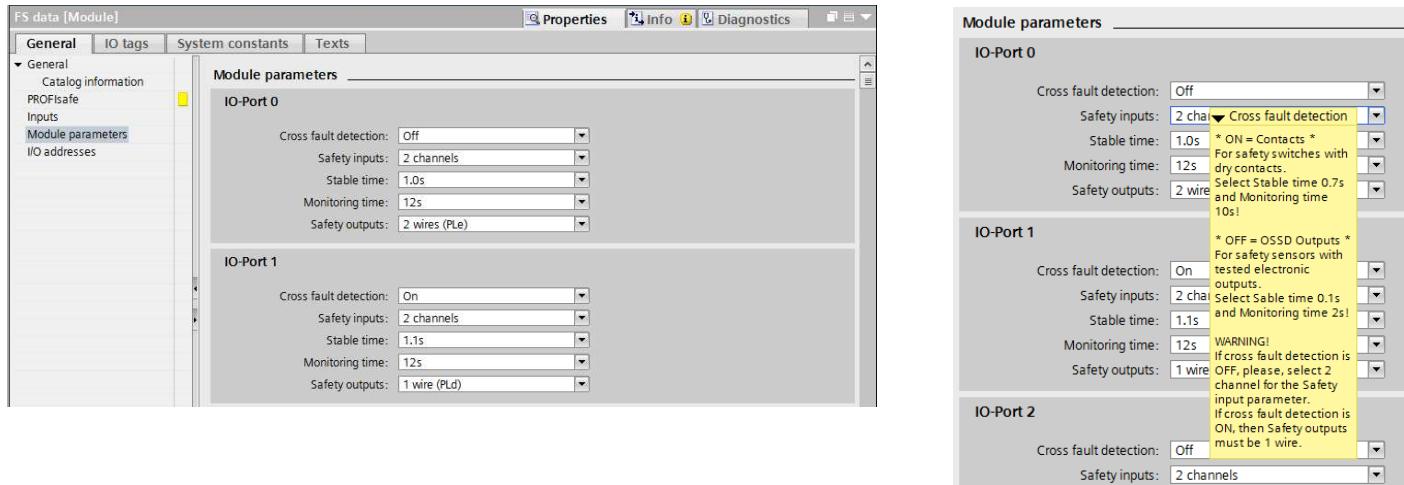

## Step 4: Set the F address (PROFIsafe address) on the field box by using the rotary coding switches and configure it in the configuration software.

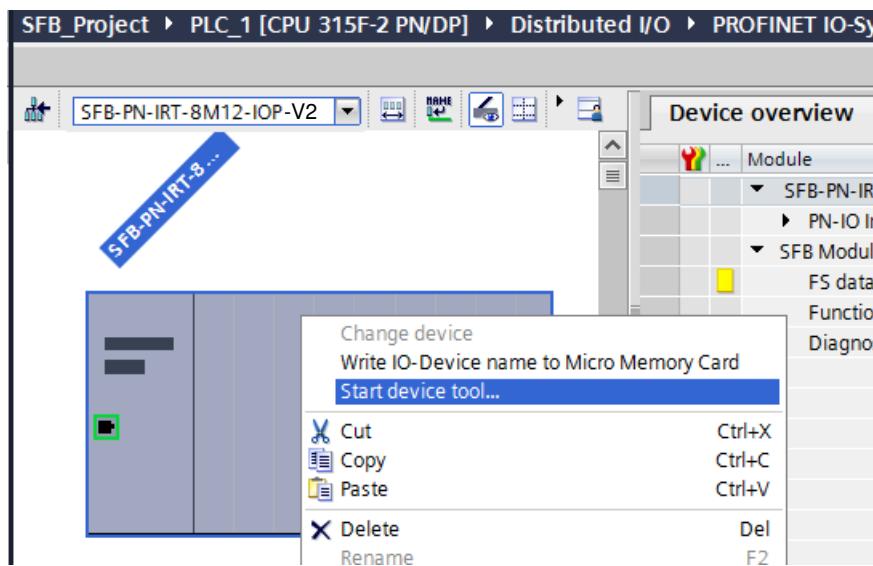

## Step 5: Set F\_WD\_Time depending on the call cycle of the safety program of the F-PLC

	<b>HINWEIS</b>
	The module only starts correctly if the call cycle of the safety program of the F-PLC is selected to be significantly shorter than the F_WD_Time. (e.g. call cycle 20 ms and F_WD_Time > 80 ms)

## Step 6: Configuring safety parameters for the 8 device ports in the F-CPU (S7 controller)

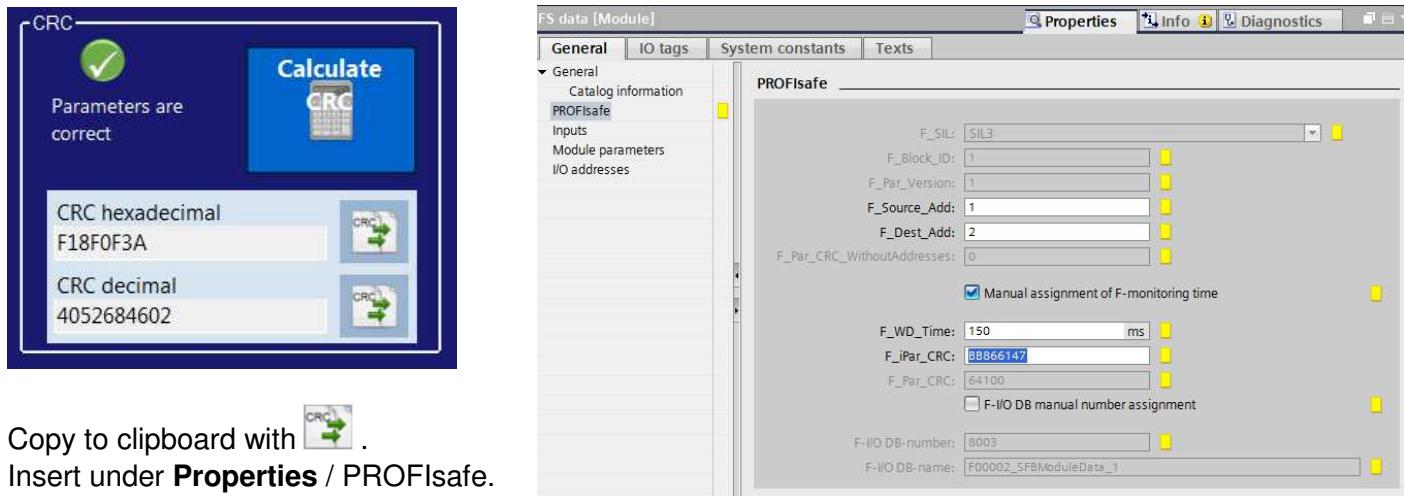

## Step 7: Call the **SFB Configuration Tool** via the TCI interface of the configuration software

**Step 8:** Check the configured safety parameters with the **SFB Configuration Tool** and calculate the F\_iPar\_CRC

**Step 9:** Copy the F\_iPar\_CRC to the S7 controller

**Step 10:** Implementing a program for the acknowledgement of module faults and device port faults

**Step 11:** Download configuration from the configuration software to the F-PLC
